BEFORE YOU BUILD

Building and Timber Pest Inspection Report

Inspection Date: Mon, 2 Mar 2026

Property Address: 11/30 Kings Rd, Ingleburn NSW 2565, Australia

Contents

If you have any queries with this report or require further information, please do not hesitate to contact the person who carried out the inspection.

This Report has been prepared in accordance with the pre-inspection agreement in place between the parties set out below, which set out the purpose and scope of the inspection, and the significant items that will be reported on. This Report reflects the opinion of the inspector based on the documents that have been provided. This Report should be read in its entirety and in the context of the agreed scope of Services. If there is a discrepancy between the summary findings and the body of the Report, the body of the Report will prevail. We recommend that you should promptly implement any recommendation or advice in this Report, including recommendations of further inspections by another specialist. If you have any queries with this Report or require further information, please do not hesitate to contact the person who carried out the inspection. This Report contains reference to material that is the copyright of Standards Australia reproduced under agreement with SAI Global to Jim's Building Inspections (Australia).

Original Inspection Date:	Mon, 2 Mar 2026
Modified Date:	Tue, 3 Mar 2026

The Parties

Name of the Client:	
Name of the Principal(If Applicable): Sydney Conveyancing Solicitors	
Job Address:	11/30 Kings Rd, Ingleburn NSW 2565, Australia
Client's Email Address:	
Client's Phone Number:	
Consultant:	Adam Ahmed Ph: 0450 250 739 Email: Lidcombe@jimsbuildinginspections.com.au
	Advanced Diploma of Building Surveying - CPCSS00004
Company Name:	Jim’s Building Inspections Lidcombe
Company Address and Postcode:	Lidcombe 2141
Company Email:	Lidcombe@jimsbuildinginspections.com.au
Company Contact Numbers:	0450 250 739

Special conditions or instructions

A report may be conditional on information provided by the person, agents or employees of the person requesting the report, apparent concealment of possible defects and a range of other factors

The following apply: Not Applicable

Section A Results of Inspection - summary

A summary of your inspection is outlined below; please also refer to the Report.

	Found	Not Found
Safety Hazard	✔	
Major Defect		✔
Minor Defect	✔	
Live Timber Pest Activity		✔
Timber Pest Damage		✔
Conditions Conducive to Timber Pest Activity	✔	
Evidence of fungal decay activity and/or damage		✔
Evidence of wood borer activity and/or damage		✔
Evidence of a previous termite management program		✔

Overall Condition (Building)

In summary, the building, compared to others of similar age and construction is in fair condition with some safety and minor defects as highlighted in the report.

Overall Condition (Timber Pest)

In summary, the building, compared to others of similar age and construction is highly susceptible to timber pests. A termite treatment is required.

Section B General

General description of the property

Building Type	Townhouse
Company or Strata title	Unknown
Floor	Brick Stumps or Piers
Furnished	Furnished
No. of bedrooms	2
Occupied	Occupied
Orientation	North West
Other Building Elements	Garage, Fence - Fabricated Metal Fence, Party Walls
Other Timber Bldg Elements	Architraves, Door Frames, Doors, Internal Joinery, Floorboards, Skirting Boards, Stair Railing, Staircase, Window Frames
Roof	Tiled, Timber Framed, Pitched
Storeys	Double
Walls	Brick Veneer, Light Weight Wall Clad
Weather	Fine

Section C Accessibility

Areas Inspected

The following areas were inspected. As documented in your Pre-Inspection Agreement, obstructions and limitations to the accessible areas for inspection are to be expected in any inspection. Refer also to our listing of obstructions and limitations.

- Exterior

- Interior

- Roof Exterior - Part

- Roof Void - Part

- Subfloor - Part

- Wall Exterior

The inspection excludes areas which are affected by obstructions, where access is limited or unsafe. We do not move obstructions and defects, timber pest activity or conditions conducive to these may not be obvious unless they are removed.

Inaccessible Areas

The following areas were inaccessible:

- Areas of low roof pitch preventing full inspection.

- Areas of skillion or flat roof - no access

- Ceiling Cavity - Part.

- Exterior Roof Surface - Second Storey.

- Inside of the fencing.

- Roof Exterior - Part

- Subfloor - Part.

- Wall Exterior - where neighbouring buildings immediately adjoin.

Any areas which are inaccessible at the time of inspection present a high risk for undetected defects and timber pest activity and conditions conducive to these. The client is advised to make inaccessible areas accessible wherever possible for re-inspection.

Obstructions and Limitations

Building defects, termite and timber pest activity as well as conditions conducive to both, may be concealed by the following obstructions which prevented full inspection:

- Above safe working height

- Appliances and equipment

- Areas of low roof pitch preventing full inspection

- Areas of skillion or flat roof - no access

- Ceiling cavity inspection was significantly obstructed with more than 75% of the inspectable area inaccessible or obstructed by factors like lack of safe access, insulation and ducting.

- Ceiling linings

- Evidence of recently painted walls or ceilings

- Evidence of remedial cleaning may result in lower levels of contaminant being detected.

- Evidence of recent renovation may obscure, temporarily lower or reduce the overall levels of contaminant detected.

- Fixed ceilings

- Fixed Furniture - Built-in Cabinetry

- Floor coverings

- Lack of natural or acceptable lighting

- Lack of clearance - subfloor

- Stored items, built in cabinetry, furniture and personal items obscured approximately 75% of every room.

- Subfloor area - Limited access due to restrictive crawl space

- Vegetation covered approximately 25% of the area for inspection.

The presence of obstructions increases the risk of undetected building defects, timber pest activity and conditions conducive to these. The client should make arrangement to remove obstructions where ever possible and re-inspect these areas urgently.

Undetected defect risk (Building)

A risk rating is provided to help you understand the degree to which accessibility issues and the presence of obstructions have limited the scope of the inspection

The risk of undetected defects is: **High**

When the risk of undetected defects is medium or high we strongly recommend further inspection once access is provided or if the obstruction can be removed. Contact us for further advice.

Undetected defect risk (Timber Pest)

A risk rating is provided to help you understand the degree to which accessibility issues and the presence of obstructions have limited the scope of the inspection

The risk of undetected defects is: **High**

When the risk of undetected defects is medium or high we strongly recommend further inspection once access is provided or if the obstruction can be removed. Contact us for further advice.

Section D Significant Items

Safety Hazard

Finding 1.01

Building:	Main Building
Location:	Above Stairs - Internal
Finding:	Smoke Detectors and Alarms
Information:	Reporting on Smoke Detectors or Alarms, including hard wired smoke detection systems and their legislative requirements, is outside the Scope of this Report.

Please note that this defect is highlighted as a caution only. We suspect, based on our experience in the building industry, that the absence of smoke detectors, or their poor condition, should be addressed as a matter of urgency to improve occupant safety.

Further Inspection and/or advisory services is necessary to provide advice on the sufficiency, type and location of smoke detectors, and to test the functionality of all devices. Greater requirements for fire safety and detection exist for commercial buildings.

Always ensure sufficient working and suitable smoke detectors are installed prior to occupying any building. Additionally, it is advised that all smoke detectors be tested by the homeowner on a monthly basis.

Please refer to AS3786 and state based legislation, which may also apply.

Finding 1.02

Building:	Main Building
Location:	All Areas
Finding:	Window child lock missing
Information:	The window in question lacks a child lock mechanism, which poses a potential safety risk to young occupants in the premises. As per Australian Standards windows

accessible to children should be equipped with appropriate child safety locks to prevent accidental opening, reducing the risk of falls and ensuring compliance with safety regulations.

Major Defect

No evidence was found

Minor Defect

Finding 3.01

Building:	Main Building
Location:	All Areas
Finding:	Perimeter - Insufficient Fall
Information:	The perimeter ground levels were found to have an inadequate slope away from the adjoining building structure, creating potential for water pooling in this area.

Perimeter is required to fall from the building by a minimum of 25mm in the first metre and bare ground should fall away from the house by 50mm in the first meter. This standard ensures that excessive moisture does not pool around the base of building structures, which creates potential for water and structural damage, as well as making the area susceptible to termite and timber pest activity.

Where ground levels do not have adequate fall, a licensed paving contractor should be appointed to install or remove and re-level pavement.

Finding 3.02

Building:	Main Building
Location:	Front Elevation
Finding:	Flashing deteriorated
Information:	The flashing installed between the timber frameworks and the panels of the building is deteriorated. This deterioration includes visible corrosion, gaps, and cracks, which compromise the effectiveness of the flashing in preventing water ingress.

Risk:

1. Water Ingress: Compromised flashing can lead to water penetration causing moisture to infiltrate the building envelope.

2. Structural Damage: Continuous exposure to moisture can lead to timber rot, weakening the structural integrity of the timber framework and surrounding materials.

3. Mold and Mildew Growth: Moist conditions promote mold and mildew growth, which can cause health issues for occupants and further damage building materials.

4. Insulation Damage: Water ingress can damage insulation, reducing the building's energy efficiency and increasing heating and cooling costs.

5. Aesthetic Issues: Water staining and damage can affect the building's appearance,

potentially lowering property value and requiring costly repairs.

Who Can Fix It:

A licensed and qualified roofer with experience in flashing installation and repair should be engaged to address this issue. The contractor will:

1. Assess the extent of the deterioration.

2. Remove the damaged flashing.

3. Install new, properly sealed flashing to ensure water tightness.

4. Inspect adjacent areas for any signs of water damage and repair as needed.

Ensuring that the flashing is correctly repaired will help maintain the building's structural integrity and prevent future water-related issues..

Finding 3.03

Building:	Main Building
Location:	Exterior walls - rear
Finding:	HWS Overflow - Not Connected
Information:	The Hot Water System (HWS) overflow was found to be disconnected from storm

water drainage and is creating excessive moisture in the surrounding area.

These damp conditions can lead to secondary defects such as rot, rust or corrosion of associated building elements, the formation of fungal decay, or even the creation of potential slip hazards. When coupled with poor site drainage, pooling of water may also attract termite activity to this area.

It is highly recommended that a licensed plumber be appointed to connect the HWS overflow in order to prevent such an environment from being created. These minor works should be carried out as soon as possible.

Finding 3.04

Building:	Main Building
Location:	Exterior walls - rear
Finding:	Brickwork - Cracking [Fine]
Information:	Although fine cracks are quite noticeable, they are often only considered to be an appearance defect and usually do not indicate any structural damage. Generally, the cause of a fine crack is indicative of a separation between brickwork and mortar throughout the structure, but single bricks may also show cracks of this nature.

Cracking of this nature can generally be repaired with minor filling and should be conducted by a qualified bricklayer.

Always contact a building inspector should cracks widen lengthen or become more numerous.

Finding 3.05

Building: Main Building
Location: Garage
Finding: Noticeable Cracking in Concrete Slab
Information: Noticeable cracking has been observed in the concrete slab, failing to meet the required construction and quality standards.

Observations:

.

- Cracks are visible on the surface and may extend through the depth of the slab.

- Evidence of improper curing or inadequate reinforcement leading to cracking.

Impact and Risks:

The presence of noticeable cracks in the concrete slab can result in:

- Compromised structural integrity of the slab, potentially leading to failure under load.

- Water ingress through cracks, causing corrosion of reinforcement and further weakening the structure.

- Potential trip hazards and aesthetic issues, reducing the overall value and safety of the property.

- Increased maintenance and repair costs due to ongoing deterioration.

Who Can Fix It:*

- A structural engineer should be engaged to assess the extent of the cracking and recommend appropriate repair methods.

- A licensed contractor or concrete repair specialist should carry out the recommended repairs under the guidance of the structural engineer.

A detailed inspection should be conducted post-repair to confirm compliance with the required standards and to ensure that the structural integrity of the concrete slab has been restored.

Finding 3.06

Building:	Main Building
Location:	Garage
Finding:	Paint Bubble
Information:	A visible paint bubble (or blister) was identified on the surface. The deformation appears as a raised area in the paint film, typically resulting from adhesion failure between the paint and substrate, possibly due to moisture, poor surface preparation,

or incompatible paint layers.

Risk Assessment:

As per AS 4349.1-2007, this is considered a minor defect. However, if moisture is the cause, it may indicate an underlying issue such as water ingress or high humidity, which could worsen over time and lead to mould growth or plasterboard deterioration if left unattended.

Rectification Recommendation:

A licensed painter or plasterer should assess the cause of the blister. If moisture is present, the source must be identified and rectified before repairs. Once dry, the affected area should be scraped back, sealed, patched, and repainted. Further investigation may be required if there is suspicion of plumbing or roofing leaks above the ceiling.

Classification (as per AS 4349.1):

Minor Defect — unless associated with active moisture ingress, in which case it may be upgraded depending on extent and cause.

Finding 3.07

Building:	Main Building
Location:	All Areas
Finding:	Roof Weathered
Information:	Upon inspection of the exterior roofing, the majority of roof was not in a fair condition. While weathering of the roof is consistent with the age of the property, maintenance works are required.

Isolated areas of mortar have come loose in the valleys and minor cracking is also present. Re-pointing and re-sealing the may be considered as an interim solution by the client to help preserve and extend the life span of the tiles.

Where left unmanaged, deteriorating roof are likely to lead to a number of secondary defects, including minor water leaks and weather exposure to internal roofing structures.

Consultation with a roofing contractor is highly advised to gain advice on cost of remedial works that may be required in the short to medium term. Remedial works are likely to increase the longevity of the exterior roofing structure.

Finding 3.08

Building:	Main Building
Location:	Subfloor
Finding:	Subfloor - Site drainage - Inadequate
Information:	The site exhibits poor drainage under the subfloor, leading to several critical issues. Water accumulates and does not properly drain away from the subfloor area, creating a hazardous condition.

Problem:

1. Frequent water pooling and stagnation under the subfloor.

2. Risk of subfloor structural damage due to prolonged moisture exposure.

3. Potential for mold and mildew growth, compromising indoor air quality and a potential of Termite attack.

4. Safety hazard for occupants due to slippery surfaces and potential electrical hazards.

The poor site drainage under the subfloor poses a significant safety risk to the occupants, as it can lead to structural damage and health hazards.

This issue requires immediate attention and rectification. A licensed and experienced plumber or licensed builder specialising in drainage and foundation work should be engaged to assess the problem and implement necessary drainage solutions, such as improved grading, installation of drainage systems, and moisture barrier enhancements. Regular maintenance and inspections should also be scheduled to prevent future occurrences. Water damage and secondary defects are likely to occur if left unmanaged.

Finding 3.09

Building:	Main Building
Location:	Kitchen
Finding:	Water damage / Vanity
Information:	"The vanity in the shower area has sustained water damage, resulting in swelling and discoloration of the wood, as well as potential structural issues. This damage compromises both the aesthetic and functional aspects of the vanity."

To fix this issue, you should consider contacting a professional:

1. **Carpenter or Woodworker:** They can assess and repair the damage to the vanity, potentially replacing any irreparable parts.

2. **Plumber:** If the water damage is due to plumbing issues, a plumber can fix leaks and ensure there are no further water-related problems.

3. **General Contractor:** If the damage is extensive and affects the surrounding area, a general contractor can coordinate the repair work, including both the vanity and any related structural or cosmetic repairs.

Make sure to obtain quotes from these professionals to determine the most cost-effective and efficient solution for your specific situation.

Finding 3.10

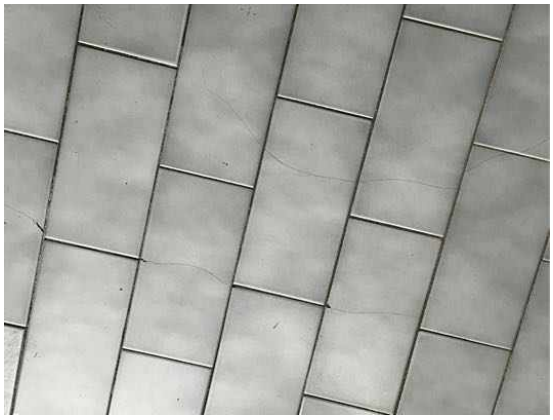
Building:	Main Building
Location:	Laundry
Finding:	Floor Tile crack
Information:	A floor tile has a visible crack on the surface.

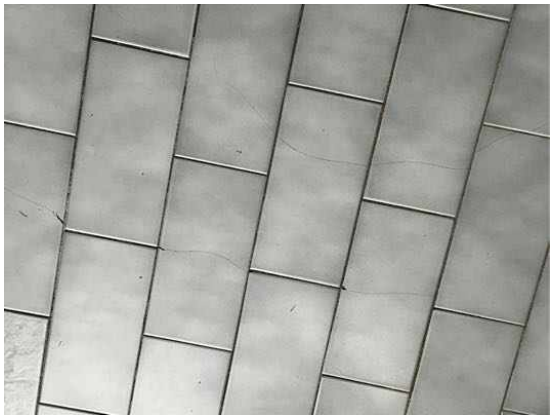
Risk / Implication:

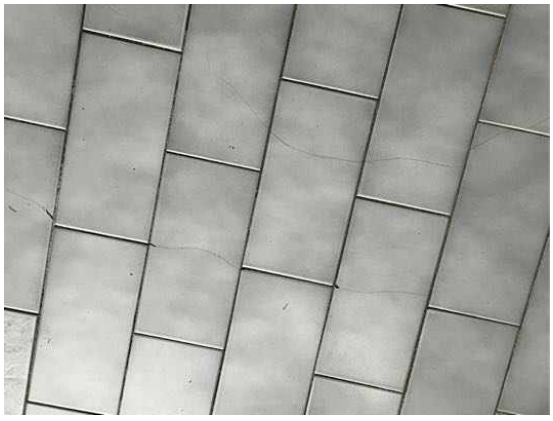
The damaged tile presents a trip hazard, may lead to cuts if stepped on barefoot, and can allow moisture ingress into the substrate, which may cause further deterioration or loosening of adjacent tiles. It also affects the overall appearance of the floor.

Recommended Action / Who Can Fix It:

A licensed tiler should be engaged to remove the damaged tile and install a matching replacement. If spare tiles are unavailable, additional remedial work may be required to blend the repair with surrounding finishes.







Finding 3.11

Building:	Main Building
Location:	Laundry
Finding:	Evidence of excessive moisture - Drywall
Information:	Excessive moisture is present at the time of , indicating a potential water leakage issue within the wall.
	The prolonged presence of moisture can lead to mold growth, deteriorate the structure, and create an environment conducive to health hazards. Additionally, it may compromise the adhesive holding the tiles, leading to their detachment.
	A licensed plumber or a qualified contractor specializing in water damage remediation

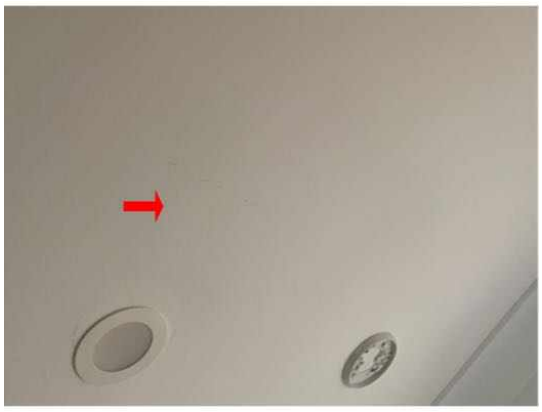
should investigate the source of the moisture, fix any leaks, and address the damage. Additionally, replacing affected tiles and ensuring proper waterproofing are crucial to preventing future issues.

Finding 3.12

Building:	Main Building
Location:	Above Stair Landing
Finding:	Gyprock - Crack (Fine)
Information:	Fine cracks have appeared in the gyprock of the ceiling, suggesting potential issues with settling or structural movement.

The fine cracks in the gyprock ceiling pose a risk of further widening, compromising the aesthetic appeal of the space, and potentially indicating underlying structural problems.

A skilled plasterer or a contractor specializing in drywall repairs should assess the extent of the cracks and address them promptly. Identifying and fixing the root cause of the issue, whether related to settling or structural concerns, is essential to prevent further damage and maintain the integrity of the ceiling.



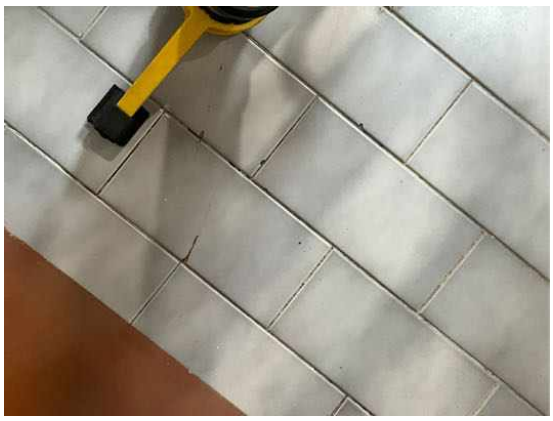
Finding 3.13

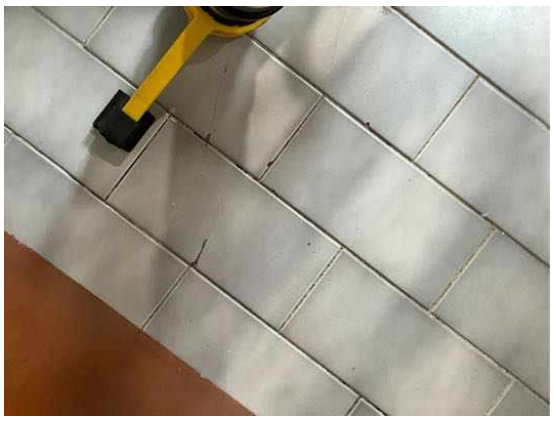
Building:	Main Building
Location:	Bathroom
Finding:	Tiles - Cracked or damaged
Information:	Cracking was evident to the tiling in this area at the time of inspection. While the cracking appears to be minor, this area is frequently exposed to water, allowing potential for water penetration into adjoining sections of walls or flooring.

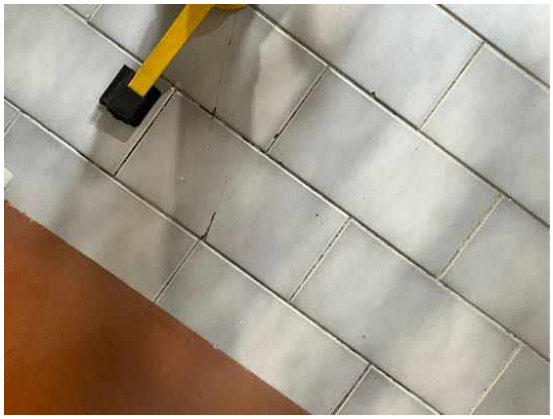
If left unmanaged, water penetration to these areas may lead to subsequent water damage, which is likely necessitate repair work to affected building elements.

A tiling contractor should be appointed to ensure that no further water damage occurs. The re-application of silicone and grouting throughout remaining tile work is also advised, to further protect the area against water penetration.

Where water penetration has led to water damage, appointment of a relevant tradesperson may be required to repair damaged building elements.







Finding 3.14

Building:	Main Building
Location:	Bathroom
Finding:	Bathtub Stains
Information:	This staining is indicative of long-term water exposure, possibly due to slow drainage, water quality issues, or the deterioration of materials in the bath.

Risk:

• Aesthetic Damage: The stains detract from the visual appeal of the bathroom and may affect its overall cleanliness perception.

• Material Degradation: The source of the stains, such as rust or hard water, may eventually contribute to the deterioration of the bathtub's surface, leading to further damage if not addressed.

• Plumbing Issues: If the staining is caused by slow drainage or leaks, this may indicate a more significant issue with the plumbing that could worsen over time.

Who Can Fix It:

• Professional Cleaner: A professional cleaner specializing in bathroom or surface restoration can attempt to remove the stains using appropriate cleaning agents.

• Plumber: If the staining is caused by slow drainage, a plumber should inspect the drainage system for blockages or leaks.

• Bath Refinishing Specialist: If the staining is severe or has caused damage to the surface, a refinishing specialist can repair or recoat the bathtub.

Finding 3.15

Building:	Main Building
Location:	Bathroom
Finding:	Damaged Tile – Potential Waterproofing Risk
Information:	Damage was observed to a tile near the bath. The tile is chipped and cracked, exposing the substrate beneath. In wet areas, such damage may compromise the integrity of the waterproofing membrane underneath, which is essential for preventing water ingress.

Implication: Ongoing exposure to water in this area may result in membrane failure, water ingress, and deterioration of subfloor materials or adjoining finishes.

Recommendation: Engage a qualified tiler or waterproofing specialist to assess the extent of damage. An invasive inspection may be necessary to verify whether the waterproofing membrane has been breached and to undertake appropriate repairs to prevent future water damage.

Finding 3.16

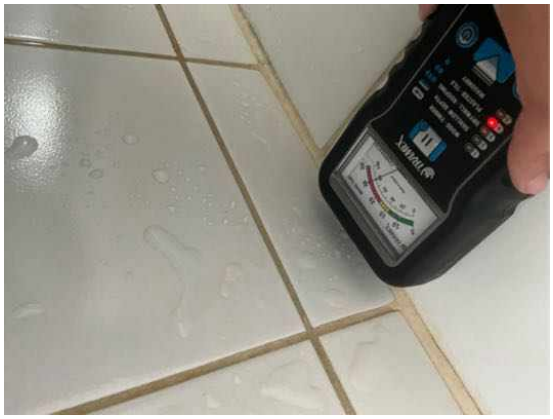
Building:	Main Building
Location:	Bathroom
Finding:	Shower - Damp
Information:	Damp is evident to the lower 300mm of wall to the shower alcove. This defect is quite common, and is suspected to have been caused by moisture permeating through the grouting in this area, which shows evidence of deterioration. Leaking pipes within the adjoining wall is also a possible cause.

Damp (or structural damp) refers to the presence of unwanted moisture in the structure of a building, either as the result of intrusion from outside, or condensation from within the structure. In the shower area, internal water leaks or other sources of excessive moisture are generally the cause of damp.

Unmanaged damp in the shower recess is likely to facilitate the formation and development of mould and fungi growth, decaying associated building materials and compromising their structural integrity. It is important to address damp conditions, as the World Health Organisation notes that excess moisture leads - on almost all indoor materials - to growth of microbes such as moulds, fungi and bacteria, which subsequently emit spores and other matter into the indoor air. Exposure to these contaminants is associated with a wide range of respiratory and other health-related problems.

Consultation with a qualified plumber or bathroom specialist is advised immediately to identify the cause of damp and to perform remedial works as required. Where excessive mould growth is present, further inspection by a specialist environmental health inspector should also be considered.

Always ensure that sealant and grout is in good condition to prevent any moisture issues occurring in the future.



Finding 3.17

Building:	Main Building
Location:	Roof Void
Finding:	Exhaust fan not vented out
Information:	The exhaust fan located within the roof void is not appropriately ducted to the external atmosphere and is currently discharging moist air directly into the roof space. This is considered a defect under AS 4349.1, as it does not meet the minimum standard of residential building performance expected under normal residential building practices.

Risk Implication:

This condition may lead to excessive condensation within the roof void, increasing the

risk of mould growth, deterioration of insulation, timber decay, and overall reduced durability of building elements. It may also result in poor indoor air quality, potentially affecting occupant health.

Recommended Action:

It is recommended that the exhaust fan be modified by a licensed HVAC contractor or qualified builder, ensuring it is properly ducted to discharge externally in accordance with manufacturer specifications, the National Construction Code (NCC), and applicable Australian Standards.

Finding 3.18

Building:	Main Building
Location:	Roof Void
Finding:	Sarking - Damaged
Information:	Sarking, a laminated aluminium foil applied to the interior of the roof covering, assists in insulating the property and acting as a vapour-barrier to the roof void and, subsequently, to the household.

Where sarking is damaged, both insulation and moisture protection of the property are inhibited. This creates a loss of energy and thus negatively impacts the energy efficiency of the property, allowing potential for moisture ingress from condensation or leaking roof tiles.

It is important to repair any holes or damaged sections of sarking to ensure that the building material is fully functional. A registered builder or qualified carpenter should be consulted to provide further advice on this defect and to perform rectification works at client discretion.

Live Timber Pest Activity

No evidence was found

Timber Pest Damage

No evidence was found

Conditions Conducive to Timber Pest Activity

Finding 6.01

Building:	Main Building
Location:	All Areas
Finding:	Timber on ground / conducive conditions to termite damage
Information:	Timber on the ground is indeed conducive to termite damage. Termites are known to

thrive in moist environments, and wood in contact with soil or moisture is more susceptible to infestation.

To prevent this, it's important to keep timber elevated and away from direct ground contact. Regular inspections and proper termite control measures are also essential to protect your wooden structures from termite damage.

Finding 6.02

Building:	Main Building
Location:	All Areas
Finding:	No Drain under tap
Information:	There is no drain installed under the tap, leading to water accumulation and creating conducive conditions for timber pests. This defect needs immediate attention to prevent potential damage and pest infestation.

Risk:

1. Water Accumulation: Without proper drainage, water can accumulate around the base of the tap, leading to persistent dampness in the surrounding area.

2. Timber Pest Infestation: The damp environment created by standing water is highly conducive to timber pests, such as termites and wood borers, which thrive in moist conditions and can cause significant damage to wooden structures.

3. Structural Damage: Prolonged exposure to moisture can lead to wood rot and deterioration of structural timber, compromising the integrity of the building.

4. Health Hazards: Persistent dampness can also promote mold and mildew growth, posing health risks to occupants.

5. Aesthetic Damage: Water stains and damage to finishes and materials around the tap area can detract from the appearance of the building and lead to costly repairs.

Who Can Fix It:

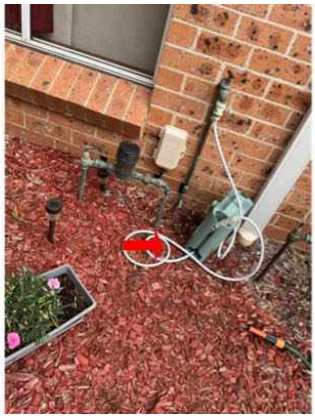
A licensed plumber or a qualified building contractor can address this defect by:

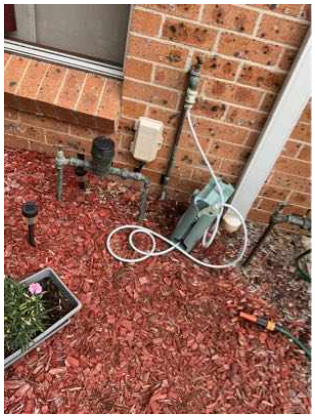
1. Assessment: Evaluating the area to determine the best approach for installing a proper drainage system under the tap.

2. Installation: Installing a drain that effectively channels water away from the base of the tap, preventing water accumulation and dampness.

3. Repair and Prevention: Inspecting and repairing any existing water damage and implementing measures to prevent future water accumulation and pest infestations.

By addressing this issue promptly, you can mitigate the risks associated with water accumulation and timber pest infestation, ensuring the longevity and safety of the building.





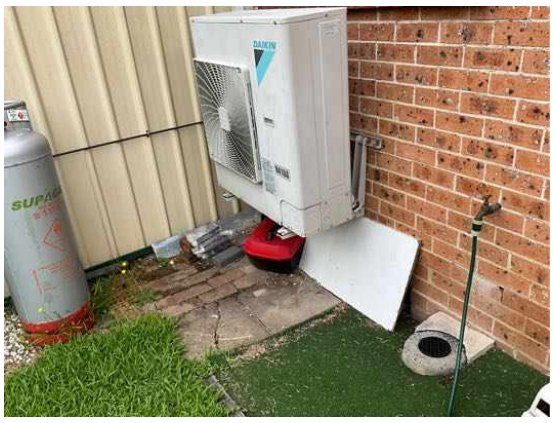
Finding 6.03

Building:	Main Building
Location:	All Areas
Finding:	Bridging or Obstruction Conducive environment for Termites
Information:	Bridging of termite barriers occurs when termites bridge (usually by building a mud tunnel) a termite barrier or inspection inspection zone or where termites have a passage, allowing them to bridge the barrier.

Shed, Garden Beds and Timber in direct contact with ground may obstruct a clear visual inspection to the walls and weep holes in this area.

Where bridging has occurred full inspection is prevented and termites may enter a property in a concealed or undetected manner.

Recommended moving obstructions away from the external walls for further and future inspections.



Finding 6.04

Building:	Main Building
Location:	Exterior walls - rear
Finding:	HWS not connected - conducive conditions for timber pest attacks
Information:	The hot water system (HWS) is not connected, leaving exposed pipes and creating conducive conditions for timber pest attacks.

Risk of Timber Pest Attack: The risk of timber pest attack is heightened when the hot water system is not connected. Exposed pipes provide easy access points for timber pests like termites and ants to infiltrate the building structure. These pests are attracted to moisture, and the absence of flowing water through the system can lead to moisture buildup, creating an ideal environment for pests to thrive and cause damage to timber components within the building.

A licensed plumber or qualified plumbing technician should be engaged to reconnect the hot water system. They will assess the existing plumbing infrastructure, determine the appropriate connection points, and ensure proper installation and functionality of the HWS. Additionally, they may inspect for any signs of timber pest activity and recommend preventive measures, such as installing physical barriers or implementing moisture control measures, to deter pest infestations and protect the building from damage. Regular maintenance and inspections by homeowners or property managers are also essential to detect and address potential issues before they escalate.

Finding 6.05

Building:	Main Building
Location:	All Areas
Finding:	Dense vegetation around a property can increase the risk of termite infestation
Information:	The presence of dense vegetation around a property can increase the risk of termite infestation, as it provides a conducive environment for them. To address this, consider maintaining a clear space between the vegetation and your home. If you suspect a termite issue, it's advisable to consult with a licensed pest control professional for inspection and treatment.

Finding 6.06

Building:	Main Building
Location:	Subfloor
Finding:	Subfloor - poor ventilation, inadequate site drainage, water stains
Information:	The subfloor lacks adequate ventilation, suffers from inadequate site drainage, exhibits water stains, creating conducive conditions for timber pests such as termites.

Risk: The combination of poor ventilation, inadequate drainage, water stains significantly increases the risk of timber pest infestations. Termites are attracted to moist environments and can thrive in subfloors with high humidity levels and water damage. The lack of proper ventilation and drainage exacerbates moisture retention, providing an ideal habitat for timber pests to establish colonies and cause extensive damage to the subfloor structure. Additionally, water stains indicate previous or ongoing moisture issues, which further attract timber pests and contribute to the deterioration of timber materials.

A licensed pest control professional specializing in timber pest management should be consulted to assess the extent of the infestation and develop a comprehensive treatment plan. They can implement strategies to eliminate existing timber pests, such as termites and prevent future infestations by addressing underlying moisture issues. Additionally, a qualified plumber or builder may be needed to improve subfloor ventilation, enhance site drainage, repair water-damaged areas. Regular inspections and maintenance are essential to ensure ongoing protection against timber pests and maintain the structural integrity of the subfloor.

Finding 6.07

Building:	Main Building
Location:	Laundry
Finding:	Excessive moisture - Conducive to Timber pest
Information:	Excessive moisture can attract termites and produce conditions that promote fungal growth and wood decay.

Excessive moisture is generally caused by deteriorated inadequate or missing roof drainage leaking plumbing pipes or fixtures poorly plumbed HWS overflows or condenser units and poor site drainage.

If mould growth has been found there may be environmental biological or health issues involved. In these cases an appropriately qualified inspector should also be contacted.

Prior to any remedial works being performed a qualified plumber should be appointed to further inspect the property and to identify the cause of the excessive moisture. Works to remove affected building elements may then be necessary and should be performed by an appropriate tradesperson.

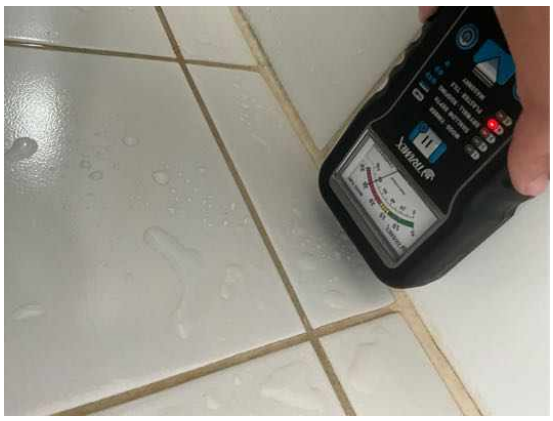
Finding 6.08

Building:	Main Building
Location:	Bathroom
Finding:	Excessive moisture - Conducive to Timber pest
Information:	Excessive moisture can attract termites and produce conditions that promote fungal growth and wood decay.

Excessive moisture is generally caused by deteriorated inadequate or missing roof drainage leaking plumbing pipes or fixtures poorly plumbed HWS overflows or condenser units and poor site drainage.

If mould growth has been found there may be environmental biological or health issues involved. In these cases an appropriately qualified inspector should also be contacted.

Prior to any remedial works being performed a qualified plumber should be appointed to further inspect the property and to identify the cause of the excessive moisture. Works to remove affected building elements may then be necessary and should be performed by an appropriate tradesperson.



Evidence of fungal decay activity and/or damage

No evidence was found

Evidence of wood borer activity and/or damage

No evidence was found

Section D Significant Items

D4 Further Inspections

We advise that you seek additional specialist inspections from a qualified and, where appropriate, licensed

- Licensed Plumber

- As identified in summary and defect statements

- Other

- Registered/Licensed Builder

- Termite and Timber Pest Technician / Licensed Pest Controller

- Registered Roofing Contractor

Jim's Building Inspections can put you in contact with qualified and licensed providers of these and other trades services. Please contact your inspector for recommendations, or visit www.jims.net.

D5 Conclusion - Assessment of overall condition of property

- Building Inspection Conclusion

A Building and Timber pest inspection was carried out on this property. At the time of inspection, a durable notice and evidence of pest treatment were not found.

Conducive conditions were observed which are noted in the body of the report.

The following recommendations are always strongly advised to minimise creating an environment which is conducive to timber pest infestation:

1. Maintain visual pest inspections every six to twelve months

2. Ensure that AC and HWS overflows are connected to a nearby down pipes and drain points if applicable

3. Ensure that if there any tree stumps in the immediate area that they are treated with an approved termicide and certified by a licensed pest technician

4. Ensure that any loose timbers, timbers or stored items in ground contact in the subfloor applicable) and around the dwelling perimeter are removed to prevent potential timber pest infestation

5. Ensure that areas of ground damp are further investigated and treated by a licensed plumber or damp proof specialist as well as addressing areas of subfloor ventilation inadequacy.

The application of a post construction chemical or physical termite barrier is highly recommended for all properties and is always good building practice. Where a slab on ground type construction is evident a 75mm perimeter visual barrier is required to be maintained to ensure effective prevention of termite infestation and concealed entry points. If this visual barrier is not obtainable we strongly recommend a more invasive follow up termite inspection to completely rule out termite or timber pest presence in the dwelling.

Termite barriers are highly effective in preventing termite attack on any timber building elements throughout the property. A durable notice should always be placed in the meter box to clearly show the treatment method used and on what date and maintained there with.

It is strongly recommended that a full inspection to AS 4349.3 or AS 3660.2 be carried out at least once every six to twelve months. Regular inspections DO NOT stop timber pest attack but are designed to limit the amount of damage that may occur by detecting problems early.

Compared to other buildings of a similar age, brick veneer / clad dwelling at the time of inspection was found to be in a fair condition with some safety and minor defects as highlighted in the report.

Significant items have been identified. These have been noted in the body of the report and will require relevant professional services to be engaged immediately to clarify further works.

Additionally, while some maintenance items may currently appear minor, they have the potential to escalate into major issues if left unaddressed.

Several limitations and obstructions impeded the inspection and, if at all feasible, should be removed, and a further inspection should be performed. Indicative images below depict some of the obstructions encountered.

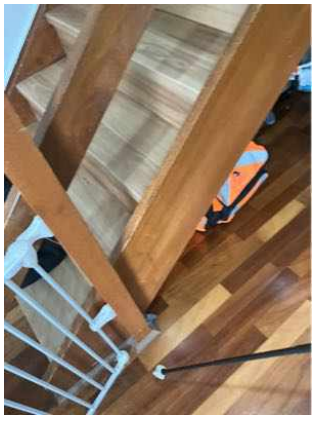
For further information, advice and clarification please contact Adam Ahmed on: 0450 250 739

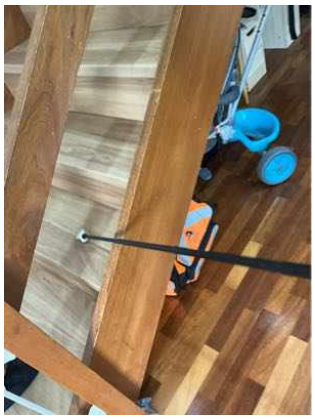
Section D Significant Items

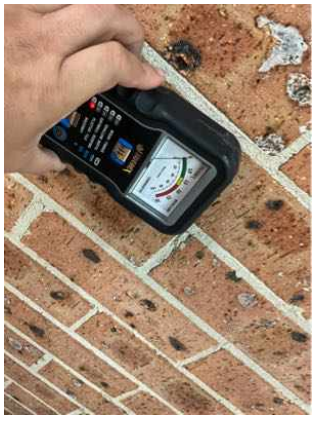
The following items were noted as - For your information

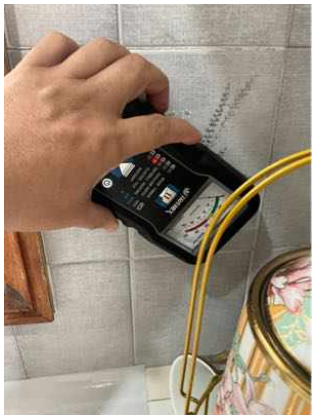
Noted Item

Building:	Main Building
Location:	All Areas
Finding:	Additional Photos
Information:	Additional photos are provided for your general reference



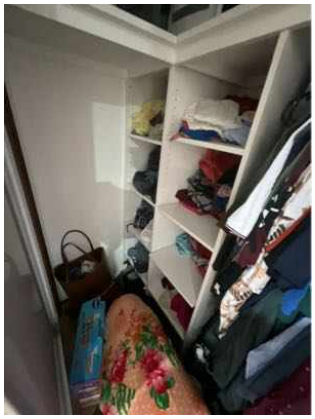


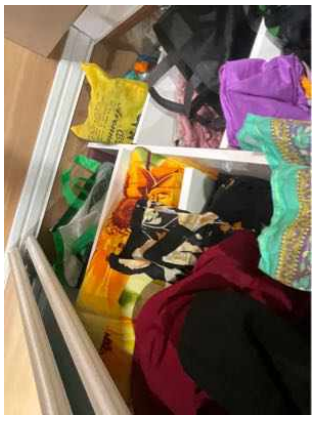


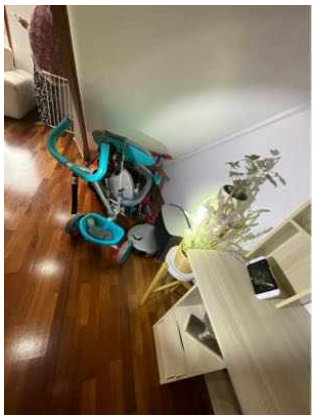


Noted Item

Building:	Main Building
Location:	All Areas
Finding:	Additional Photos - Obstructions and Limitations
Information:	These photographs are an indication of the obstructions and limitations which impeded full inspection of the property at the time of inspection. These obstructions can hide an array of defects and should be removed to allow full inspection to be carried out. A re-inspection is recommended once the areas are made accessible.







Midea

Definitions to help you better understand this report

Access hole (cover)	An opening in flooring or ceiling or other parts of a structure (such as service hatch, removable panel) to allow for entry to carry out an inspection, maintenance or repair.
Accessible area	An area of the site where sufficient, safe and reasonable access is available to allow inspection within the scope of the inspection.
Appearance defect	Fault or deviation from the intended appearance of a building element.
Asbestos-Containing Material (ACM)	Asbestos-containing material (ACM) means any material or thing that, as part of its design, contains asbestos.
Building element	A portion of a building that, by itself or in combination with other such parts, fulfils a characteristic function. NOTE: For example supporting, enclosing, furnishing or servicing building space.
Client	The person or other entity for whom the inspection is being carried out.
Conditions Conducive to Termite Activity	Noticeable building deficiencies or environmental factors that may contribute to the presence of Termites.
Defect	Fault or deviation from the intended condition of a material, assembly, or component.
Detailed assessment	An assessment by an accredited sampler to determine the extent and magnitude of methamphetamine contamination in a property.
Inspection	Close and careful scrutiny of a building carried out without dismantling, in order to arrive at a reliable conclusion as to the condition of the building.
Inspector	Person or organisation responsible for carrying out the inspection.
Instrument Testing	Where appropriate the carrying out of Tests using the following techniques and instruments: (a) electronic moisture detecting meter - an instrument used for assessing the moisture content of building elements (b) stethoscope - an instrument used to hear sounds made by termites within building elements (c) probing - a technique where timber and other materials/areas are penetrated with a sharp instrument (e.g. bradawl or pocket knife), but does not include probing of decorative timbers or finishes, or the drilling of timber and trees and (d) sounding - a technique where timber is tapped with a solid object. (e) T3I - an instrument used to detect movement, moisture and changes in temperature within timber
Limitation	Any factor that prevents full or proper inspection of the building.
Major defect	A defect of sufficient magnitude where rectification has to be carried

	out in order to avoid unsafe conditions, loss of utility or further deterioration of the property.
Methamphetamine	An amphetamine-type stimulant that is highly addictive. Methamphetamine is a controlled substance, classified as a Class A (very high-risk) drug under the Misuse of Drug Act. This term is used as a grouping term to include all substances screened for, specifically: Ephedrine, Pseudoephedrine,Amphetamine, Methamphetamine, MDA and MDMA.
Methamphetamine contamination	A property or part of a property where the level of methamphetamine has been tested in accordance with this standard and found to exceed 0.5 micrograms/100 cm2 (Residential) or 10 micrograms/100 cm2 (Commercial).
Methamphetamine production/manufacture	The manufacture of methamphetamine, including processing, packaging, and storage of methamphetamine and associated chemicals.
Minor defect	A defect other than a major defect.
Roof space/Roof void	Space between the roof covering and the ceiling immediately below the roof covering.
Screening assessment	An assessment by a screening sampler to determine whether or not methamphetamine is present.
Serviceability defect	Fault or deviation from the intended serviceability performance of a building element.
Significant item	An item that is to be reported in accordance with the scope of the inspection.
Site	Allotment of land on which a building stands or is to be erected.
Structural defect	Fault or deviation from the intended structural performance of a building element.
Structural element	Physically distinguishable part of a structure. NOTE: For example wall, columns, beam, connection.
Subfloor space	Space between the underside of a suspended floor and the ground.
Subterranean Termite Management Proposal	A written proposal in accordance with Australian Standard AS 3660.2 to treat a known subterranean termite infestation and/or manage the risk of concealed subterranean termite access to buildings and structures.
Termites	Wood destroying insects belonging to the order 'Isoptera' which commonly attack seasoned timber.
Tests	Additional attention to the visual examination was given to those accessible areas which the consultant's experience has shown to be

	particularly susceptible to attack by Termites. Instrument Testing of those areas and other visible accessible timbers/materials/areas showing evidence of attack was performed.
Timber Pest Activity	Tell-tale signs associated with 'active' (live) and/or 'inactive' (absence of live) Timber Pests at the time of inspection.
Timber Pest Attack	Timber Pest Activity and/or Timber Pest Damage.
Timber Pest Damage	Noticeable impairments to the integrity of timber and other susceptible materials resulting from an attack by Timber Pests.
Urgent and Serious Safety Hazards	Building elements or situations that present a current or immediate potential threat of injury or disease to persons.

Terms on which this report was prepared

This report is based on the condition of the property at the time of inspection. We strongly recommend re-inspection 30 days after this report is issued as the general condition of the property is likely to have changed, including the extent of defects described and instance of potential undetected defects.

This report has been prepared in accordance with and subject to the pre-inspection agreement in place between the parties, which forms part of this Report.

This Report is prepared for the client identified above and may not be relied on by any other person without our express permission or by the purchase of this Report on our website.

SPECIAL ATTENTION SHOULD BE GIVEN TO THE SCOPE, LIMITATIONS AND EXCLUSIONS IN YOUR PRE-INSPECTION AGREEMENT AND THIS REPORT

Any of the exclusions or limitations identified for this Report may be the subject of a special-purpose inspection which we recommend being undertaken by an appropriately qualified inspector

RELIANCE AND DISCLOSURE

This report has been prepared based on conditions at the time of the report.

We own the copyright in this report and may make it available to third parties.

If your Property is in the Australian Capital Territory, you acknowledge we will make certain information about this Report available to the ACT Government for inclusion in the building and pest inspections public register if required under the *Civil Law (Sale of Residential Property) Act 2003* . This will include the fact the report has been prepared, the Property street address, date of the inspection, the name of the person who prepared the report and (if applicable) the entity that employs them.

UNDETECTED DEFECT RISK RATING

If this Report has identified a medium or high-risk rating for undetected defects, we strongly recommend a further inspection of areas that were inaccessible. This may include an invasive inspection that requires the removal or cutting of walls, floors or ceilings.

If the Property has been vacant for a period of time, moisture levels or leaks may not be detectable at the time of the inspection because often only frequent use of water pipes (showers, taps etc) result in a leak being identifiable. We advise further testing on pipes and water susceptible areas (such as the bathroom and laundry) after more frequent use has occurred.

IMPORTANT SAFETY INFORMATION:

This is not a report by a licensed plumber or electrician. We recommend a special-purpose

report to detect substandard or illegal plumbing and electrical work at the Property

This is not a smoke alarm report. We recommend all existing detectors in the Property be tested and advice sought as to the suitability of number, placement and operation.

This is not an asbestos report. There are potential products in the Property containing asbestos that will not be identified in this report. In order to accurately identify asbestos, we recommend performing an asbestos inspection, particularly for buildings built prior to 1988.

This is not a report on safety glass. Glazing in older homes may not reflect current standards and may cause significant injury if damaged. Exercise caution around the glass in older homes.

This is not a report on window opening restrictions. We have not inspected window opening restrictors. Window openings in older buildings may not reflect current standards and can be a potential risk. Window opening restrictors are advised for all second story or above windows with sill heights below 900mm. Some states make this a mandatory requirement. Owners should enquire of their local and state requirements to ensure compliance.

This is not a report on pool safety. If a swimming pool is present it should be the subject to a special purpose pool inspection.

External Timber Structures - Balcony and Decks. It is strongly recommended that a Structural Engineer is required to assess distributed load capacity of external timber structures such as balconies and decks, alerting users of the load capacity. Regular maintenance and inspections by competent practitioners to assess the ongoing durability of exposed external timber structures are needed.

This is not a Group Titled Property Report as per AS4349.2. If you require a report for a Group Titled Property as per this standard, please seek a separate inspection for Group Titled Properties.

MOISTURE

The identification of moisture, dampness or the evidence of water penetration is dependent on the weather conditions at the time an inspection. The absence of dampness identified in this Report does not necessarily mean the Property will not experience some damp problems in other weather conditions or that roofs, walls or wet areas are watertight.

Where the evidence of water penetration is identified we recommend detailed investigation of waterproofing in the surrounding area monitoring of the affected area over a period of time to fully detect and assess the cause of dampness.

MAINTENANCE OF THE PROPERTY

This Report is not a warranty or an insurance policy against problems developing with the Property in the future. Accordingly, a preventative maintenance program should be implemented which includes systematic inspections, detection and prevention of issues. Please contact the inspector who carried out this inspection for further advice.

It is strongly advised that appropriate steps be taken to remove, rectify or monitor any evidence of

conditions conducive to timber pest activity. Undertaking thorough regular inspections at intervals not exceeding twelve months (or more frequent inspections where the risk of timber pest attack is high or the building type is susceptible to attack). To further reduce the risk of subterranean termite attack, implement a management program in accordance with Australian Standard AS3660. This may include the installation of a monitoring and/or baiting system, or chemical and/or physical barrier. However, AS3660 stresses that subterranean termites can bridge or breach barrier systems and inspection zones and those thorough regular inspections of the building are necessary.

NO CERTIFICATION

a) The Property has been compared to others of a similar age, construction type and method that had an acceptable level of basic maintenance completed.

b) We don't advise you about title, ownership or other legal matters like easements, restrictions, covenants and planning laws. None of our inspections constitutes approval by a Building Surveyor, a certificate of occupancy or compliance with any law, regulation or standard, including any comment on whether the Property complies with current Australian Standards, Building Regulations or other legislative requirements.

RECTIFICATION COSTS

We don't provide advice on the costs of rectification or repair unless specifically identified in the scope of the Report. Any cost advice provided verbally or in this report must be taken as of a general nature and is not to be relied on. Actual costs depend on the quality of materials, the standard of work, what price a contractor is prepared to do the work for and may be contingent on approvals, delays and unknown factors associated with third parties. No liability is accepted for costing advice.
