BEFORE YOU BUILD

Building and Timber Pest Inspection Report

Inspection Date: Tue, 10 Mar 2026

Property Address: 6 Stuart Mould Cres, Lalor Park NSW 2147, Australia

Contents

If you have any queries with this report or require further information, please do not hesitate to contact the person who carried out the inspection.

This Report has been prepared in accordance with the pre-inspection agreement in place between the parties set out below, which set out the purpose and scope of the inspection, and the significant items that will be reported on. This Report reflects the opinion of the inspector based on the documents that have been provided. This Report should be read in its entirety and in the context of the agreed scope of Services. If there is a discrepancy between the summary findings and the body of the Report, the body of the Report will prevail. We recommend that you should promptly implement any recommendation or advice in this Report, including recommendations of further inspections by another specialist. If you have any queries with this Report or require further information, please do not hesitate to contact the person who carried out the inspection. This Report contains reference to material that is the copyright of Standards Australia reproduced under agreement with SAI Global to Jim's Building Inspections (Australia).

Original Inspection Date: Tue, 10 Mar 2026

The Parties

Name of the Client:	
Name of the Principal(If Applicable):	
Job Address:	6 Stuart Mould Cres, Lalor Park NSW 2147, Australia
Client's Email Address:	
Client's Phone Number:	
Consultant:	Terry Masoudi * Ph: 0420 990 777 Email: Parramatta@jimsbuildinginspections.com.au
	161360C
Company Name:	Jim's Building Inspections (Parramatta)
Company Address and Postcode:	Marsden Park 2765
Company Email:	Parramatta@jimsbuildinginspections.com.au
Company Contact Numbers:	0420 990 777

Special conditions or instructions

A report may be conditional on information provided by the person, agents or employees of the person requesting the report, apparent concealment of possible defects and a range of other factors

The following apply: This report does not comment on common areas.
This report is based on the condition of the property at the time of inspection. We strongly recommend re-inspection 30 days after this report is issued as the general condition of the property is likely to have changed, including the extent of defects described and instance of potential undetected defects.

Section A Results of Inspection - summary

A summary of your inspection is outlined below; please also refer to the Report.

	Found	Not Found
Safety Hazard	✔	
Major Defect	✔	
Minor Defect	✔	
Live Timber Pest Activity		✔
Timber Pest Damage		✔
Conditions Conducive to Timber Pest Activity	✔	
Evidence of fungal decay activity and/or damage	✔	
Evidence of wood borer activity and/or damage		✔
Evidence of a previous termite management program		✔

Overall Condition (Building)

In summary, the building, compared to others of similar age and construction is in fair condition with some major and minor defects found.

Overall Condition (Timber Pest)

In summary, the building, compared to others of similar age and construction is highly susceptible to timber pests. A termite treatment is required.

Section B General

General description of the property

Building Type	Detached, Residential
Company or Strata title	No
Floor	Part Slab and Part Subfloor, Suspended Timber Frame, Brick Stumps or Piers
Furnished	Furnished
No. of bedrooms	3
Occupied	Occupied
Orientation	North
Other Building Elements	Garage, Pergola, Fence - Fabricated Metal Fence, Carport, Shed, Driveway, Patio
Other Timber Bldg Elements	Door Frames, Doors, Fascias, Internal Joinery, Landscaping Timbers and Construction, Deck, Architraves, Floating Floor, Window Frames, Skirting Boards
Roof	Pitched, Tiled, Timber Framed
Storeys	Single
Walls	Weatherboards
Weather	Overcast

Section C Accessibility

Areas Inspected

The following areas were inspected. As documented in your Pre-Inspection Agreement, obstructions and limitations to the accessible areas for inspection are to be expected in any inspection. Refer also to our listing of obstructions and limitations.

- Exterior

- Interior

The inspection excludes areas which are affected by obstructions, where access is limited or unsafe. We do not move obstructions and defects, timber pest activity or conditions conducive to these may not be obvious unless they are removed.

Inaccessible Areas

The following areas were inaccessible:

- Roof Exterior - Part

- Roof Void due to lack of access.

Any areas which are inaccessible at the time of inspection present a high risk for undetected defects and timber pest activity and conditions conducive to these. The client is advised to make inaccessible areas accessible wherever possible for re-inspection.

Obstructions and Limitations

Building defects, termite and timber pest activity as well as conditions conducive to both, may be concealed by the following obstructions which prevented full inspection:

- Debris in gutters

- Ceiling linings

- Appliances and equipment

- Above safe working height

- Evidence of recently painted walls or ceilings

- External concrete or paving

- External finished ground level

- Fixed Furniture - Built-in Cabinetry

- Floor coverings

- Furniture

- Wall linings

- Stored items, built in cabinetry, furniture and personal items obscured approximately 50% of every room.

- Landscaping

The presence of obstructions increases the risk of undetected building defects, timber pest activity and conditions conducive to these. The client should make arrangement to remove obstructions where ever possible and re-inspect these areas urgently.

Undetected defect risk (Building)

A risk rating is provided to help you understand the degree to which accessibility issues and the presence of obstructions have limited the scope of the inspection

The risk of undetected defects is: **High**

When the risk of undetected defects is medium or high we strongly recommend further inspection once access is provided or if the obstruction can be removed. Contact us for further advice.

Undetected defect risk (Timber Pest)

A risk rating is provided to help you understand the degree to which accessibility issues and the presence of obstructions have limited the scope of the inspection

The risk of undetected defects is: **High**

When the risk of undetected defects is medium or high we strongly recommend further inspection once access is provided or if the obstruction can be removed. Contact us for further advice.

Section D Significant Items

Safety Hazard

Finding 1.01

Building:	Main Building
Location:	Carport
Finding:	Paving -- Uneven (Safety hazard)
Information:	

Sections of the external paved area are uneven, creating a potential trip hazard. It appears as though the area has been subject to rough installation, or that paving sections have lifted due to movements in the foundation.

Where paving creates a trip hazard, personal injury may ensue if due caution is not taken by all persons within this area.

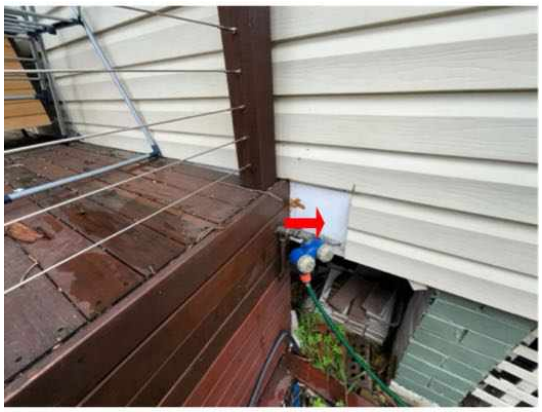
Re-paving of the area is required urgently to remedy this situation. Further consultation with a specialist concreter is highly advised.

Finding 1.02

Building:	Main Building
Location:	Multiple areas
Finding:	Asbestos - Suspected ACM Identified on Site
Information:	Reporting on Asbestos is outside the Scope of this Report. This suspected defect is highlighted as a caution only. We suspect, based on our experience in the building industry, that there is a higher risk of the identified building element containing asbestos.

As Asbestos Reporting is outside the scope of this report, we advise that you consider a separate Asbestos Inspection and Condition Audit, which can include the taking of samples for definitive confirmation of the presence of Asbestos.

In the interim, the client is advised to act with caution, especially when considering any damage to building materials general wear and tear renovations extensions demolition and general maintenance activities due to the suspected presence of Asbestos.



Finding 1.03

Building:	Main Building
Location:	Laundry
Finding:	Mould present - Ventilation
Information:	Evidence of mould growth was noted, which is believed to have grown due to lack of ventilation to the area.

Generally, the client is advised to ensure that the general environment is free of moisture and humidity to aid in the prevention of mould formation and development. Any mould found during the inspection should be cleaned immediately by a cleaning contractor or the homeowner as applicable.

Although the exhaust fan was found to be working at the time of inspection, however a licensed electrician May be appointed to ensure the full exhaust fan operation.

Major Defect

Finding 2.01

Building:	Main Building
Location:	Shed

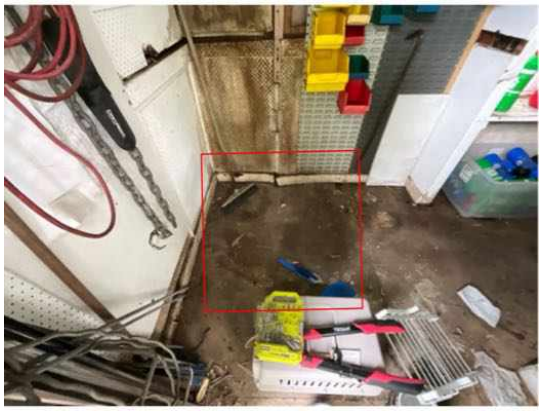
Finding: Damp - Rain penetration

Information: Rain penetration (also known as penetrating damp) is a common form of dampness that can occur through walls, roofs or openings (e.g. windows).

Common causes include faulty or missing flashing, cracked tiles, degraded pointing, lack of sealant and blocked weep holes. Rain penetration can also occur when water tracks horizontally under the lip of eaves and roof linings with insufficient angles, or by tracking across wall ties.

The cause of the water leak should be addressed immediately to prevent further damage. It is recommended that the water leak be resolved prior to any repairs of the damaged area, which may require localised replacement of building materials and refinishing.

Trades responsible for such works may include licensed builder, licensed plumber, roof restoration specialist and landscaper.



Finding 2.02

Building: Main Building

Location: Subfloor

Finding: Building element - Damaged

Information: Breakage occurs generally when the building materials have either aged and decayed,

or as a result of damage (accidental or deliberate).

Repair and/or replacement of broken elements is advised to ensure that additional secondary defects do not arise as a consequence. Such works are necessary, as all building elements play a key role in the operation and function of the overall structure and its performance.

A relevant tradesperson should be appointed to repair or replace the affected building element prior to any subsequent damage being caused.

Finding 2.03

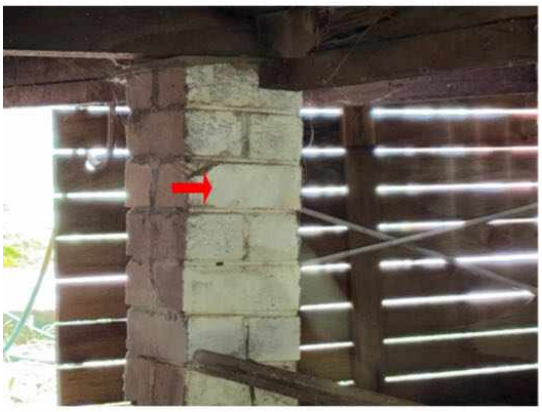
Building:	Main Building
Location:	Carport
Finding:	Building element - Damaged
Information:	Breakage occurs generally when the building materials have either aged and decayed, or as a result of damage (accidental or deliberate).

Repair and/or replacement of broken elements is advised to ensure that additional secondary defects do not arise as a consequence. Such works are necessary, as all building elements play a key role in the operation and function of the overall structure and its performance.

A licensed builder should be appointed to repair or replace the affected building element prior to any subsequent damage being caused.

Finding 2.04

Building:	Main Building
Location:	Subfloor
Finding:	Piers -- Leaning (major)
Information:	Some piers to the subfloor are not supporting the suspended structure adequately, indicating that their structural integrity have been affected. The cause of this instability is likely to be caused by movement / subsidence of the pier due to moisture. Inadequate support is likely to lead to a range of other secondary major and minor defects and hence immediate rectification to this pier is required by a registered builder. Monitoring and when required improving site drainage is recommended to avoid further movement / subsidence of the affected piers.



Finding 2.05

Building:	Main Building
Location:	Carport & driveway
Finding:	Subsidence - Local trees and vegetation
Information:	Trees and other vegetation can have a significant local effect on drying of soils. Over a number of years, especially during drought conditions, adjacent trees and vegetation may draw excessive moisture from the soils. The opposite may also occur, where swelling of the soil results when the trees decline or are removed.

As the cumulative moisture deficient is reversed, the surface level around the tree (and adjoining subfloor) will rise and expand laterally. This is often damaging to structures unless the foundations have been strengthened or designed to cope with the effect.

Subsidence can have complex and varying causes, which will influence the required remedial works. It is advised to begin by consulting a structural engineer to determine the required scope of works. This generally includes some form of underpinning, as well as addressing the underlying cause. Consultation with a geotechnical engineer may also be necessary.

Minor Defect

Finding 3.01

Building:	Main Building
Location:	Yard
Finding:	Site drainage— Inadequate
Information:	The site drainage in this area was found to be inadequate at the time of inspection, creating potential for subsequent water damage to associated building elements. This is additionally conducive to termite activity.

It is important that water does not lie against the base of walls; surrounding paths and ground levels should be sloped to drain water away from walls. Downpipes should not disgorge stormwater onto lower walls or plinths. Stormwater should be carried away by large, regularly cleaned drains. Ground levels may need to be lowered to expose a buried DPC.

Where site drainage is inadequate, installation of an Agricultural (Aggie) Drain may be required. A licensed plumber should be appointed to further inspect the property and perform any remedial works as necessary. Water damage and secondary defects are likely to occur if left unmanaged.

Finding 3.02

Building:	Main Building
Location:	Multiple areas of roof plumbing
Finding:	Water leak - External
Information:	Water leaks were found to be present to exterior plumbing work. Leaks are generally caused by deterioration of the plumbing elements over time, due to exposure to weather conditions, but may have also been caused by minor impact damage.

Such leaking creates damp conditions in the affected area, causing potential for water pooling and subsequent water damage if left unattended. These conditions may also attract termite attack, particularly if the area is subject to minimal levels of sun throughout daylight hours.

It is highly advised that a licensed plumber be appointed to rectify any water leaks that may be present. Areas of repair and replacement of plumbing fittings and fixtures may be required and, as such, a quotation should be sought.

Finding 3.03

Building:	Main Building
Location:	Multiple areas
Finding:	Building element - Damaged
Information:	Breakage occurs generally when the building materials have either aged and decayed, or as a result of damage (accidental or deliberate).

Repair and/or replacement of broken elements is advised to ensure that additional secondary defects do not arise as a consequence. Such works are necessary, as all building elements play a key role in the operation and function of the overall structure and its performance.

A relevant tradesperson should be appointed to repair or replace the affected building element prior to any subsequent damage being caused.

Finding 3.04

Building: Main Building

Location: Kitchen

Finding: Water leak - Active

Information: Generally, water leaks occur when a particular area of the property is not weather or water tight. As the surrounding area was found to be damp at the time of inspection, the leak is considered ongoing and hence requires urgent action.

Regardless of the location, even minor leaks that are left unmanaged can lead to serious damage of associated building elements and result in the need for replacement of building materials. Mould and other hazards such as electrical hazards may also arise if the leak is left to develop.

It is highly advised that the cause of the leak be identified and resolved immediately by a licensed plumber to prevent any further damage. Depending on the extent of the damage previously sustained, repair and/or replacement of any affected building materials may be required.

Finding 3.05

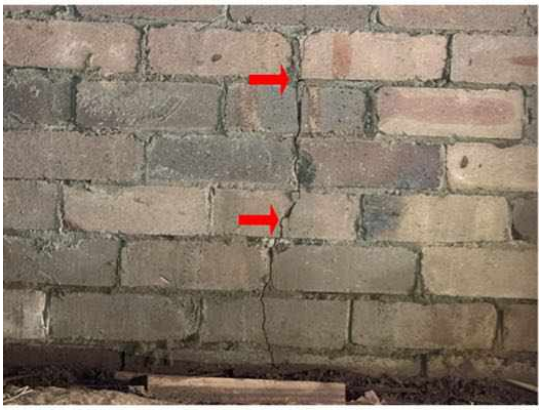
Building: Main Building

Location: Subfloor

Finding: Damage to Masonry Walls (Cracks) - Category 1

Information: It has been observed that damage to masonry walls caused by movement of slabs, footings, or other causes, has occurred. The degree of damage falls within Category 1, described as fine cracks, which are less than 1.0mm in width limit, and that do not need repair.

Damage of this category is not considered a defect for rectification. Always contact your building inspector should cracks widen, lengthen, or become more numerous.



Finding 3.06

Building: Main Building

Location: Subfloor

Finding: Pipework - Leaking into subfloor

Information: Dampness to localised sections of the subfloor area was identified. It is suspected that this dampness has occurred due to leaking pipes in this area, which may be exacerbated by poor site drainage and inadequate subfloor ventilation.

Dampness in this area is likely to lead to wood rot and general deterioration of structures within the subfloor space. Excessive moisture also creates an environment which is conducive to termite and pest infestation.

A licensed plumber should be appointed immediately to repair any pipes that may be leaking. This will ensure a dry subfloor space as well as improving the water efficiency of the property.

Finding 3.07

Building:	Main Building
Location:	Multiple areas
Finding:	External surfaces — Holes
Information:	Significant hole and penetration was identified to this area.

Whether intentional or not, gaps and holes to external surfaces are susceptible to insect and vermin ingress, as well as allowing water penetration to the cavity wall. As such, associated building elements are likely to deteriorate at an accelerated rate, and major implications are expected if holes around the pipework are left unmanaged.

All excessive holes, gaps or cracks should be adequately filled by a suitable sealant or trimmings as soon as possible to prevent any further damage. Such works may be conducted by a general handyperson or licensed carpenter.

Finding 3.08

Building:	Main Building
Location:	Multiple areas
Finding:	Beads - Missing
Information:	Beading acts (like cornice or skirtings) to cover the intersection or joins of building materials. It was noted at the time of inspection that beading in this area is missing.

Beading is important in weatherproofing the surrounding building elements and preventing pest ingress. Furthermore, beading works to protect the joins of building materials, which are more susceptible to deterioration and decay.

Replacement of the beading is advised to ensure the protection and longevity of any associated building elements. Such works may be performed by a general handyperson or licensed carpenter.

Finding 3.09

Building:	Main Building
Location:	Multiple areas
Finding:	Stormwater drain - Not connected
Information:	The roof plumbing is not adequately connected to stormwater drainage on the site. This disconnection negatively impacts the functional capacity of the roof plumbing. Where roof plumbing doesn't drain adequately, the area at the base perimeter can become excessively damp, potentially creating an environment that is susceptible to rust and corrosion of surrounding building elements, as well as attracting termites and other pests. It is highly recommended that a plumber be appointed to further inspect the area and to install adequate drainage equipment where necessary.

Finding 3.10

Building:	Main Building
Location:	Subfloor
Finding:	Plumbing - Point of connection non-compliant
Information:	At the time of inspection it was noted that connections between above ground pipe work and below ground sewer/storm water systems were incomplete.

At the point of connection, the connection should be sealed against vermin and debris entering the sewer / storm water system. The sealing method depends upon the age and type of the pipe work being connected.

Additionally, where sewer pipes are concerned, gases can escape from unsealed connections which can pose a serious health risk.

Engagement of a certified plumber is strongly recommended to ensure all connection points are sealed in accordance with the plumbing construction guidelines.

Finding 3.11

Building:	Main Building
Location:	Fencing
Finding:	Fencing - Deteriorated
Information:	It was noted at the time of inspection that sections of the fencing in this area has deteriorated. Typically fencing deteriorates due to age and or wear, rot and or rust which is generally expected for a structure of this age, due to prolonged exposure to weather conditions. Sometimes inadequate installation or maintenance can be to blame.

If left unattended, it is likely that further damage will occur. It is suspected that repair of several elements of the fencing may be required however replacement may be a consideration of the client also.

A licensed fencing contractor should be appointed to provide further advice and perform rectification works as necessary.

Finding 3.12

Building:	Main Building
Location:	Multiple areas
Finding:	Cracking - External Concrete Paving Damage Category 4 - Gaps in Slab (4mm - 10mm +)
Information:	Gaps in the slab were identified in external concrete paving. Gaps in the slab are significant and are likely to lead to the development of safety hazards and secondary defects if left unmanaged, such as the creation of a trip hazard.

General age and expected deterioration of the paved areas is a common cause of this type of cracking. However, expansion and contraction of the slab may also have occurred due to environmental factors. Such factors include variable moisture and weather conditions, the presence of trees and their roots having a settling or lifting affect on the soil, or the effect of load bearing, e.g. heavy vehicles over a sustained period of time.

Cracking to this degree may also be due to poor original installation of the concrete. Factors such as poor compaction of the sub surface and/or inadequate reinforcing of the slab may create cracking and other secondary defects. Gaps in the concrete paving may also have a more significant structural cause, such as subsidence of soils.

Where gaps in the concrete paving are adjacent to structural elements of the building, the advice of a Structural Engineer is advisable before undertaking repairs.

Finding 3.13

Building:	Main Building
Location:	Bathroom
Finding:	Wet area tiles - Cracked or damaged
Information:	Cracking was evident to the tiling in this area at the time of inspection. While the cracking appears to be minor, this area is frequently exposed to water, allowing potential for water penetration into adjoining sections of walls or flooring.

If left unmanaged, water penetration to these areas may lead to subsequent water damage, which is likely necessitate repair work to affected building elements.

A bathroom specialist should be appointed to determine the integrity of the bathroom waterproofing membrane. If the membrane was found to be intact then relatively minor works to replace the cracked tiles should be carried out to ensure no further damage occurs. The re-application of silicone and grouting throughout remaining tile work is also advised, to further protect the area against water penetration.

Finding 3.14

Building:	Main Building
Location:	Bathrooms

Finding: Sealant and grouting - Missing or damaged

Information:

It was noted on inspection that sealant or grout is degraded to this area.

Different materials and floor areas move at different rates, generally causing cracking to grout or sealant at this point. A flexible sealant is required to allow for expected expansion and contraction, while keeping the joint water tight and protective of all associated building materials.

Flexible and mould resistant materials should be applied to affected areas to prevent any subsequent water damage that is likely to occur. Regular maintenance and replacement of damage or missing or damaged sealant and grout is highly recommended to the wet areas, as this is a regular wear and tear defect. Sealant and grouting in areas that come into regular contact with water should be maintained for the long term care of your property.

A sealant specialist should be appointed to complete these works as soon as possible.

Finding 3.15

Building: Main Building

Location: Roof Exterior

Finding: Roof plumbing - Flashing inadequate

Information: Some sections of the roof are missing or have inadequate roof flashings. Flashings are metal and other materials which are applied to seals and intersections between roof coverings and building elements. They are designed to aid in weatherproofing of roof joins.

Flashings that are not installed adequately or are missing are likely to result in water penetration to the interior of the property, as well as creating excessively damp conditions against the exterior surfaces and around the base perimeter of the building.

Premature ageing and secondary building defects are imminent where roof plumbing is missing or inadequately installed. Additionally, water pooling also creates an environment that is susceptible to termite and pest infestation.

A roofing plumber should be appointed as soon as possible to install relevant roof plumbing materials, ensuring that no further damage is sustained.

Finding 3.16

Building: Main Building

Location: Rear corner

Finding: Mortar - Deterioration

Information: Mortar, or 'bedding', is the material which fills joins and intersections between tiles and other building elements on the exterior roof covering, such as gable ends, hip capping and valleys. Upon inspection of the exterior roof, it was noted that sections of the mortar show varying levels of deterioration.

Mortar generally deteriorates as a result of frequent exposure to weather conditions over a prolonged period of time. Mortar that is deteriorating may allow water ingress into the roof void, putting associated building elements and roofing structures at risk of water damage. Deteriorated mortar also detracts from the functionality of roof tiles and other roofing elements, potentially decreasing weather tightness and roof drainage.

Mortar deterioration can be attended to by a handyperson where areas of deterioration are localised and easily accessible. Otherwise, consultation with a roofing contractor is advised where greater works are required.

Finding 3.17

Building:	Main Building
Location:	Roof Exterior
Finding:	Trees - Overhanging and filling gutters
Information:	Overhanging trees often result in excessive amounts of leaf debris accumulating in gutters.

Gutters are a critical part of the building's management of storm water and rain. It is therefore important that they be kept clear to prevent secondary damage to associated building elements, including exterior and interior walls, ceiling linings and any adjoining building elements. Where gutters are blocked, pooling of rainwater is likely to occur, fast-tracking rust and corrosion of the roof plumbing elements.

It is highly advised that all overhanging tree branches be removed as soon as possible to prevent any further damage. Repair and/or replacement of sections of damaged guttering may also be required where the extent of the damage necessitates.

Such works should be performed by the homeowner; however, appointment of a landscape contractor or an arborist may be required. Consultation with a licensed roof plumber is required where guttering has been damaged.

Finding 3.18

Building:	Main Building
Location:	Shed, deck
Finding:	Roof plumbing - Missing
Information:	Some sections of the roof are not adequately drained via gutters and downpipes. Gutters and downpipes that are not installed adequately are likely to result in excessively damp conditions against the exterior surfaces and around the base perimeter of the building. Excessive moisture creates an environment which accelerates the deterioration of building elements in the area, as well as being conducive to termite and pest infestation. Such an environment is likely to necessitate repair and/or replacement of

building elements, which are prone to sustaining wood rot, rust or corrosion.

A roofing plumber should be appointed as soon as possible to install relevant roof plumbing materials. Depending on the extent of the damage, repair and/or replacement of damaged building elements may be required.

Finding 3.19

Building:	Main Building
Location:	Bedroom - Master
Finding:	Door - Binding/jamming
Information:	

Binding and/or jamming of this door is evident during standard operation. This defect inhibits the functionality of the affected door as well as creating potential for secondary defects to associated building elements, such as damage to the floor covering or adjacent frame.

A door that binds to flooring or to the associated door frame may have several causes, ranging from minor defects, such as poor installation of the door or deteriorated hinges.

A licensed carpenter should be appointed to perform minor rectification works at client discretion.

Finding 3.20

Building:	Main Building
Location:	Laundry
Finding:	Plumbing - Non-Compliant
Information:	The plumbing work in this area does not appear to be compliant to the current Australian standard practices. A complying trap was found to be missing at the time of inspection.

Plumbing and electrical inspections are outside the scope of the building inspection and must be conducted by a Licensed and registered Trades person.

It is highly recommended that the client makes immediate arranges to have the plumbing work inspected to ensure compliance.

Whilst we note and comment of visually apparent defects that present during the building inspection, legislation requires the checking and documenting of compliance for plumbing and electrical requirements be done by licensed electrician and plumbers respectively to ensure they are functioning correctly.

Finding 3.21

Building:	Main Building
Location:	Dining Room
Finding:	Incomplete or substandard works
Information:	The works to this area appear to be incomplete or have been completed to a substandard level.

Works that have not been completed to a satisfactory level create potential for the development of building defects and may impede on the safety and integrity of the overall structure.

It is highly recommended that a licensed electrician be appointed to complete these works and ensure the safety of the area and the longevity of all associated building

elements.

Finding 3.22

Building:	Main Building
Location:	Multiple areas
Finding:	Paint cracking and peeling
Information:	Cracking and ultimately flaking of paint can occur for a variety of reasons. Often these failures are due to the fact that the paint has inadequate adhesion and flexibility, both common problems with lower quality exterior flat paints.

When timber is involved, moisture intrusion results in swelling of the wood surface followed by contraction as the wood dries. The expansion and contraction cycles, can result in cracking and subsequent paint failure by flaking and peeling.

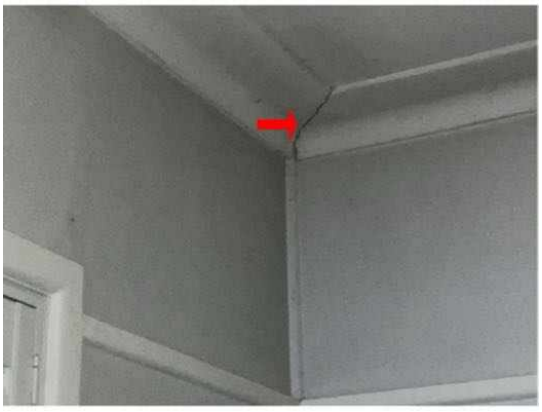
Cracking and flaking can also result when paint is applied too thinly due to overspreading (higher-than-recommended spread rate) or excessive thinning. These practices tend to diminish the paint's final film thickness, so that it is more vulnerable to cracking and flaking.

Inadequate surface preparation can also cause these failures, especially when paint is applied to bare wood or a very porous surface without first applying a primer.

A qualified painter should be appointed to rectify the problem.

Finding 3.23

Building:	Main Building
Location:	Multiple areas
Finding:	Damage to Masonry Walls (Cracks) - Category 1
Information:	It has been observed that damage to masonry walls caused by movement of slabs, footings, or other causes, has occurred. The degree of damage falls within Category 1, described as fine cracks, which are less than 1.0mm in width limit, and that do not need repair. Damage of this category is not considered a defect for rectification. Always contact your building inspector should cracks widen, lengthen, or become more numerous.

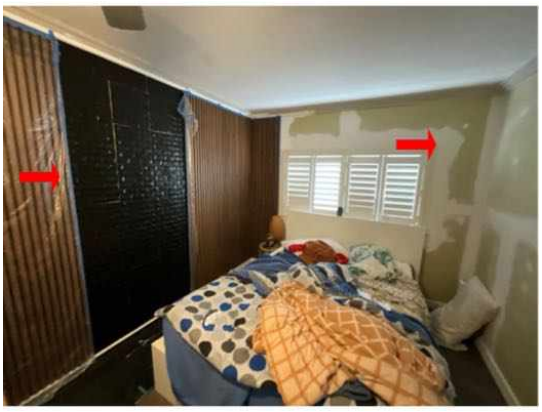


Finding 3.24

Building:	Main Building
Location:	Deck
Finding:	Timber - exposed to weather
Information:	External timbers that are frequently exposed to harsh weather conditions require adequate protection in order to maintain their condition. Where timbers have not been painted or treated adequately, general deterioration is likely to occur at an accelerated rate. If left unattended, replacement of these timbers is likely to be necessary in the short-term future. Adequate treatment of these timbers is required as soon as possible by a painting contractor or general handyman.

Finding 3.25

Building:	Main Building
Location:	Multiple areas
Finding:	Incomplete or substandard works
Information:	The works to this area appear to be incomplete or have been completed to a substandard level. Works that have not been completed to a satisfactory level create potential for the development of building defects and may impede on the safety and integrity of the overall structure. It is highly recommended that the relevant trades be appointed to complete these works and ensure the safety of the area and the longevity of all associated building elements.



Live Timber Pest Activity

No evidence was found

Timber Pest Damage

No evidence was found

Conditions Conducive to Timber Pest Activity

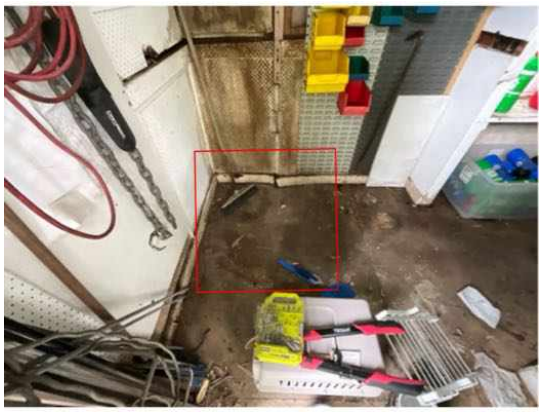
Finding 6.01

Building: Main Building
Location: Shed
Finding: Damp - Rain penetration
Information: Rain penetration (also known as penetrating damp) is a common form of dampness that can occur through walls, roofs or openings (e.g. windows).

Common causes include faulty or missing flashing, cracked tiles, degraded pointing, lack of sealant and blocked weep holes. Rain penetration can also occur when water tracks horizontally under the lip of eaves and roof linings with insufficient angles, or by tracking across wall ties.

The cause of the water leak should be addressed immediately to prevent further damage. It is recommended that the water leak be resolved prior to any repairs of the damaged area, which may require localised replacement of building materials and refinishing.

Trades responsible for such works may include licensed builder, licensed plumber, roof restoration specialist and landscaper.



Finding 6.02

Building: Main Building
Location: Multiple areas of roof plumbing

Finding: Water leak - External

Information: Water leaks were found to be present to exterior plumbing work. Leaks are generally caused by deterioration of the plumbing elements over time, due to exposure to weather conditions, but may have also been caused by minor impact damage.

Such leaking creates damp conditions in the affected area, causing potential for water pooling and subsequent water damage if left unattended. These conditions may also attract termite attack, particularly if the area is subject to minimal levels of sun throughout daylight hours.

It is highly advised that a licensed plumber be appointed to rectify any water leaks that may be present. Areas of repair and replacement of plumbing fittings and fixtures may be required and, as such, a quotation should be sought.

Finding 6.03

Building: Main Building

Location: Subfloor

Finding: Pipework - Leaking into subfloor

Information: Dampness to localised sections of the subfloor area was identified. It is suspected that this dampness has occurred due to leaking pipes in this area, which may be exacerbated by poor site drainage and inadequate subfloor ventilation.

Dampness in this area is likely to lead to wood rot and general deterioration of structures within the subfloor space. Excessive moisture also creates an environment which is conducive to termite and pest infestation.

A licensed plumber should be appointed immediately to repair any pipes that may be leaking. This will ensure a dry subfloor space as well as improving the water efficiency of the property.

Finding 6.04

Building:	Main Building
Location:	Multiple areas
Finding:	Bridging or breaching of termite barriers - damp course level
Information:	Bridging is the spanning of a termite barrier or inspection zone so that subterranean termites are provided with passage over or around that barrier.

Breaching is the making of a hole or gap in a termite barrier so that termites are provided with a passage through that barrier.

Damp proof course (DPC) is a barrier of impervious material built into a wall or pier to prevent moisture form moving to any part of the building. Where external ground levels are built up over this barrier ingress is provided for moisture from the exterior grounds into the base brickwork or other building material and allowed to rise.

Such conditions attract termites into these damp areas which is likely to lead to infestation if left untreated.

While retrospective fitting of DPC is considered to be impractical works are required in order to prevent the extraction of moisture from the external environment into exterior brickwork or wall materials. Landscaping or re-paving of external grounds may be considered by the client. Regular annual inspections are strongly advised.

Finding 6.05

Building:	Main Building
Location:	Multiple areas
Finding:	Stormwater drain - Not connected
Information:	The roof plumbing is not adequately connected to stormwater drainage on the site. This disconnection negatively impacts the functional capacity of the roof plumbing. Where roof plumbing doesn't drain adequately, the area at the base perimeter can become excessively damp, potentially creating an environment that is susceptible to rust and corrosion of surrounding building elements, as well as attracting termites and other pests. It is highly recommended that a plumber be appointed to further inspect the area and to install adequate drainage equipment where necessary.

Finding 6.06

Building:	Main Building
Location:	Meter Box
Finding:	Termite Management System - no evidence of installation
Information:	The application of a post-construction chemical termite barrier is highly recommended for all properties, particularly if live termite activity has been found on the site

previously. Such barriers are highly effective in preventing termite attack on any timber building elements throughout the property.

A durable notice should be placed in the switchboard unit to indicate current termite barriers. At the time of inspection, it appeared as though no termite management system has been installed, with no evidence to suggest preventative works taking place.

The client may consider gaining further advice from a pest controller as to the costs and procedures involved with this application. It is recommended that obtaining such advice be a short-term priority.

Finding 6.07

Building:	Main Building
Location:	Fencing & Landscaping
Finding:	Building materials in direct ground contact - conducive to termites
Information:	Where timber elements are in direct contact with the ground and consequently moisture or dampness they become conducive to termite activity. Whether timber is used as a building element part of a fencing structure or stored as an unused item they can provide an environment that is attractive to termite infestation.

When met with excessive moisture timber begins to decay and develop wood rot. Any timbers that are in direct contact with external grounds especially if left untreated or non-durable also provide ingress for subterranean termites into that particular element.

The removal of any such materials that may be conducive to termite activity should be removed as soon as possible to minimise the risk of termite attack.

Finding 6.08

Building:	Main Building
Location:	Garden beds
Finding:	Garden Beds - Conditions Conducive to Termites
Information:	Garden beds were found to be evident in the garden area. These garden beds can include untreated timber, and with a combination of moisutre from watering hosing can make conditions conducive to termite activity and termite ingress.

Finding 6.09

Building:	Main Building
Location:	Subfloor
Finding:	Stored timbers - subfloor space or external area
Information:	The storing of timbers in the subfloor space or around the external property increases the risk of termite activity being present. As they are likely to come into contact with weather conditions or excessive moisture wood rot is likely to develop on timbers that are not treated. It is highly recommended that any stored timbers be immediately removed from areas in which they may attract any termite / timber pest attack. Minimisation of risk / prevention of termite attack is far more adequate than dealing with the presence of termite activity.

Finding 6.10

Building:	Main Building
Location:	front elevation
Finding:	Bridging - Vegetation
Information:	Where vegetation obstructs inspection of building elements, also known as bridging as it provides a bridging point for the access of termites, full inspection can not be achieved. Consequently moisture or dampness may be present and the areas becomes conducive to termite activity. Plants against or very close to buildings provide cover, shade and can provide an environment that is attractive to termite infestation. The removal and replanting of species that do not provide "cover" or cutting back of existing vegetation will assist greatly in preventing Bridging from occurring. The removal of any such materials that may be conducive to termite activity should be carried out as soon as possible and arrange re inspection to minimize the risk of termite attack.

Finding 6.11

Building:	Main Building
Location:	Surrounding bush

Finding: Surrounding bushland - Conducive

Information: Home and or building is situated in a high risk area for termite activity, due to close proximity to surrounding bushland.

Finding 6.12

Building: Main Building

Location: External taps

Finding: Tap - No drain

Information: The external tap in this area was noted to have no drain at the time of inspection.

This keeps the surrounding surfaces damp while using the tap, which becomes conducive to termite activity.

A licensed plumber must be appointed to ensure an appropriate drain is installed.

Finding 6.13

Building: Main Building

Location: Shed, deck >

Finding: Roof plumbing - Missing

Information: Some sections of the roof are not adequately drained via gutters and downpipes. Gutters and downpipes that are not installed adequately are likely to result in excessively damp conditions against the exterior surfaces and around the base perimeter of the building.

Excessive moisture creates an environment which accelerates the deterioration of building elements in the area, as well as being conducive to termite and pest infestation. Such an environment is likely to necessitate repair and/or replacement of building elements, which are prone to sustaining wood rot, rust or corrosion.

A roofing plumber should be appointed as soon as possible to install relevant roof plumbing materials. Depending on the extent of the damage, repair and/or replacement of damaged building elements may be required.

Finding 6.14

Building: Main Building

Location: Subfloor

Finding: Subfloor - Debris

Information: An array of debris was found in the subfloor area at the time of inspection. Debris in this area restricts subfloor ventilation and creates potential for concealed pest entry. Stored timbers and other materials may also make the area susceptible to termite activity and wood rot.

A clear and empty subfloor will be better ventilated and easier to maintain in a dry condition. The removal of any timber debris is vital in minimising the risk of termite or wood borer activity.

Debris in the subfloor should be removed as soon as possible. Depending on the location and amount of debris and stored items, the homeowner may elect to undertake this task. Alternatively there are a large number of rubbish removal subcontractors that could undertake these works.

Evidence of fungal decay activity and/or damage

Finding 7.01

Building: Main Building

Location: Yard

Finding: Site drainage— Inadequate

Information: The site drainage in this area was found to be inadequate at the time of inspection, creating potential for subsequent water damage to associated building elements. This is additionally conducive to termite activity.

It is important that water does not lie against the base of walls; surrounding paths and ground levels should be sloped to drain water away from walls. Downpipes should not disgorge stormwater onto lower walls or plinths. Stormwater should be carried away by large, regularly cleaned drains. Ground levels may need to be lowered to expose a buried DPC.

Where site drainage is inadequate, installation of an Agricultural (Aggie) Drain may be required. A licensed plumber should be appointed to further inspect the property and perform any remedial works as necessary. Water damage and secondary defects are likely to occur if left unmanaged.

Finding 7.02

Building: Main Building

Location: Shed, carport

Finding: Wood rot/decay

Information: This building element shows evidence of wood rot. Wood rot, also known as Fungal Decay, occurs when timbers and other cellulose building materials are exposed to damp conditions on an ongoing basis. This could be the result of exposure to

weathering over a prolonged period of time, or the attraction of excessive moisture from other abutting building materials. Contributing factors also include poor air ventilation in the area.

Wood rot is often associated with general damp problems and is evidenced by a `musty` smell or mould and mildew occurring on surfaces. If left unmanaged, damp conditions can lead to further health problems and the decay of timbers will continue.

Early intervention and regular maintenance, particularly of exterior timbers, will prolong the useful life of these building elements. Prior to any works being performed, the cause of the moisture that has created the visible wood rot should be identified and addressed in a suitable manner. Replacement of affected timbers may then be a necessary step in protecting surrounding building elements from such deterioration.

A licensed plumber may be appointed to assess the cause of excessive moisture and to provide advice on any remedial works as required. A licensed carpenter may also be required to replace affected building materials.

Evidence of wood borer activity and/or damage

No evidence was found

Section D Significant Items

D4 Further Inspections

We advise that you seek additional specialist inspections from a qualified and, where appropriate, licensed

- As identified in summary and defect statements

- Asbestos Inspector

- Licensed Electrician

- Licensed Plumber

- Licensed Plumber specialising in Roof Plumbing

Jim's Building Inspections can put you in contact with qualified and licensed providers of these and other trades services. Please contact your inspector for recommendations, or visit www.jims.net.

D5 Conclusion - Assessment of overall condition of property

- This summary must be read in conjunction with the defects list.
The purchaser should ensure all extensions and additions are council approved and completed by licensed trades.
A manhole was not installed to the ceiling, hence the roofvoid was not accessible.

SAFETY HAZARDS

A safety hazard was in relation to ACM. As per outlined in this report it is only suspected, however until it is tested, it will have to be treated as suspected asbestos. We recommend further laboratory testing for verification.

Mould was identified to the laundry ceiling, indicative of poor air ventilation to the room. Mould must be removed urgently for air quality purposes.

Uneven paving to the carport has created a trip and fall hazard, requiring urgent works by a structural engineer and a concrete specialist.

MAJOR DEFECTS

Subsidence is affecting the carport area, requiring immediate repair by a structural engineer and a concrete specialist.

A major defect was identified in the subfloor due to the leaning piers. A licensed builder should be

engaged for consultation and rectifications.

A timber bearer was found to have been damaged to the subfloor during plumbing repairs. A licensed builder must be appointed urgently for repairs or reinforcement.

A carport post was found to have been damaged, requiring immediate repair by a licensed builder.

Damp penetration was identified to the shed, requiring urgent rectifications by a licensed builder, roof restoration specialist, plumber and landscaper.

MINOR DEFECTS

The following recommendations are highly advised immediately to avoid further damage or deterioration of building elements:
- Address poor site drainage
- Repair the pipework leak to the subfloor space
- Address water leak under the kitchen sink
- Repair deteriorated sealant and grouting
- Repair deteriorated area of roof tile mortar at rear corner
- Rectify defective area of roof flashing
- Clean blocked guttering regularly
- Seal all holes appropriately and install beads where necessary
- Replace missing areas of roof plumbing

Repair of all other defects are recommended. If left unattended, secondary minor or major defects can ensue.

Please be aware that limitation's did affect the inspection and areas of low clearance and poor access meant a complete inspection of the roof space and subfloor was not possible and areas of stored items, insulation and garden vegetation meant some areas were obstructed.
It is strongly recommended that full access is gained as major defects and/or damage may be concealed.
Please read all the defects and recommendations carefully and read the report in its entirety.

TIMBER PEST SUMMARY

The following items are highly recommended:
- A licensed termite specialist should be appointed for a further assessment based on AS3660.2.2000.
- Installation of a termite chemical barrier is highly recommended
- Address poor site drainage
- Lower raised ground levels where necessary and remove any bridging
- Investigate & address any leaks

- Remove any stored or loose timbers
- Remove subfloor debris
- Appropriately connect all downpipes to stormwater drainage
- Trees over 100mm diameter on the property should be drilled and tested for termite activity
- Regular inspections every 6 months

Additional information:
- Trees within 50m of the house that are on other properties or common grounds were not inspected.

For further information, advice and clarification please contact Terry Masoudi * on: 0420 990 777

Section D Significant Items

The following items were noted as - For your information

Noted Item

Building:	Main Building
Location:	Kitchen
Finding:	Smoke Detectors and Alarms
Information:	Reporting on Smoke Detectors or Alarms, including hard wired smoke detection systems and their legislative requirements, is outside the Scope of this Report.

Please note that this defect is highlighted as a caution only. We suspect, based on our experience in the building industry, that the absence of smoke detectors, or their poor condition, should be addressed as a matter of urgency to improve occupant safety.

Further Inspection and/or advisory services is necessary to provide advice on the sufficiency, type and location of smoke detectors, and to test the functionality of all devices. Greater requirements for fire safety and detection exist for commercial buildings.

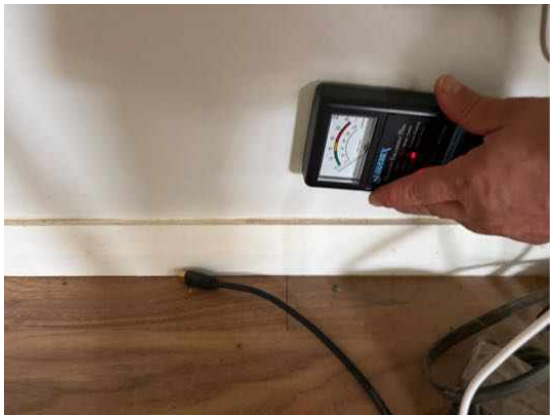
Always ensure sufficient working and suitable smoke detectors are installed prior to occupying any building. Additionally, it is advised that all smoke detectors be tested by the homeowner on a monthly basis.

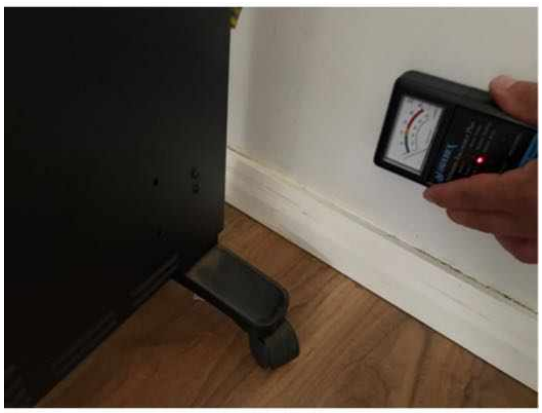
Please refer to AS3786 and state based legislation, which may also apply.

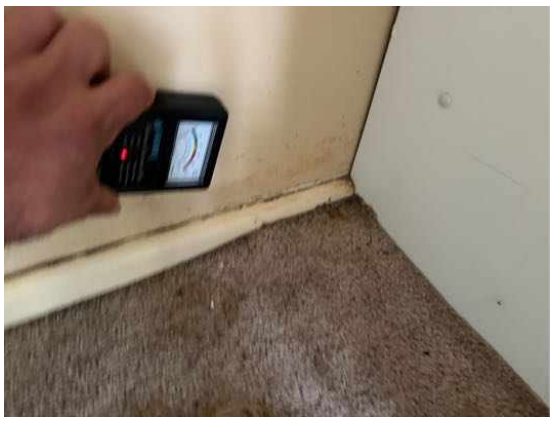
Noted Item

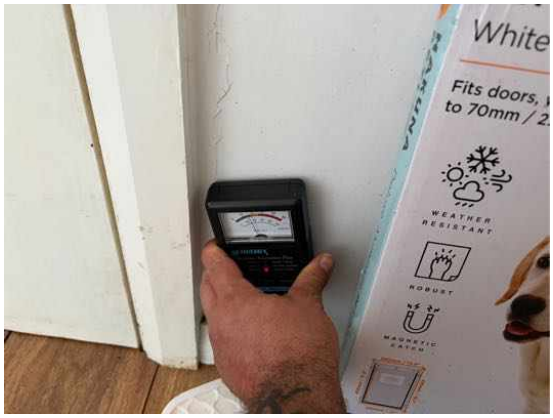
Building:	Main Building
Location:	All Areas
Finding:	Moisture metre
Information:	During the inspection the property was checked for moisture using a moisture metre.

This is for information only.









Noted Item

Building:	Main Building
Location:	Roof Void
Finding:	Roof void - Access not possible
Information:	Access to the roof void was not possible because no access panel was located at the time of inspection. It is highly advised a licensed carpenter be appointed immediately to install an appropriate access panel for maintenance purposes.

Noted Item

Building:	Main Building
Location:	All Wet Areas
Finding:	Additional Photos
Information:	Additional photos are provided for your general reference.

Noted Item

Building:	Main Building
Location:	Roof Exterior
Finding:	Additional Photos
Information:	

Additional photos are provided for your general reference.

Noted Item

Building: Main Building
Location: Subfloor
Finding: Additional Photos
Information:

Additional photos are provided for your general reference.

Noted Item

Building:	Main Building
Location:	Plumbing/electrical/gas/aircon/appliances/pool equipment/fire safety etc
Finding:	Plumbing & Electrical
Information:	Plumbing and electrical inspections are outside the scope of the building inspection and must be conducted by a Licensed and registered Trades person.It is highly recommended that the client makes immediate arrangements to have the gas appliances checked by a licensed gas plumber to ensure that the appliances are working safely and efficiently.We recommend all other installations be checked also.Whilst we note and comment of visually apparent defects that present during the building inspection, legislation requires the checking and documenting of compliance for plumbing and electrical requirements be done by licensed electrician and plumbers respectively to ensure they are functioning correctly.

Noted Item

Building:	Main Building
Location:	All Areas
Finding:	Site drainage
Information:	Unless mentioned as a defect further up this report, site drainage appears to be acceptable at the time of inspection, however, the site/yard should be monitored during heavy rain to determine whether the existing drains can cope. If it appears that

they cannot cope, then additional drains may be required.The general adequacy of site drainage is not included in the Standard Property Inspection Report. Comments on surface water drainage are limited as where there may have been either little or no rainfall for a period of time, surface water drainage may appear to be adequate during the inspection but then during periods of heavy rain, may be found to be inadequate.Any comments made in this section are relevant only in light of the conditions present at the time of inspection. It is recommended that a Smoke Test be obtained to determine any illegal connections, blocked or broken drains.

Noted Item

Building:	Main Building
Location:	Pipework
Finding:	Pipework - Old urban wear pipes
Information:	Old urban wear pipes were identified at the time of inspection.
	Consultation with a licensed plumber is advised. CCTV inspection on pipes may be required.

Noted Item

Building:	Main Building
Location:	All Areas
Finding:	Additional Photos - Obstructions and Limitations
Information:	
	These photographs are an indication of the obstructions and limitations which impeded full inspection of the property at the time of inspection. These obstructions can hide an array of defects and should be removed to allow full inspection to be carried out.A re-inspection is recommended once the areas are made accessible.

BU 99 AN

Roofvoid inaccessible

Definitions to help you better understand this report

Access hole (cover)	An opening in flooring or ceiling or other parts of a structure (such as service hatch, removable panel) to allow for entry to carry out an inspection, maintenance or repair.
Accessible area	An area of the site where sufficient, safe and reasonable access is available to allow inspection within the scope of the inspection.
Appearance defect	Fault or deviation from the intended appearance of a building element.
Asbestos-Containing Material (ACM)	Asbestos-containing material (ACM) means any material or thing that, as part of its design, contains asbestos.
Building element	A portion of a building that, by itself or in combination with other such parts, fulfils a characteristic function. NOTE: For example supporting, enclosing, furnishing or servicing building space.
Client	The person or other entity for whom the inspection is being carried out.
Conditions Conducive to Termite Activity	Noticeable building deficiencies or environmental factors that may contribute to the presence of Termites.
Defect	Fault or deviation from the intended condition of a material, assembly, or component.
Detailed assessment	An assessment by an accredited sampler to determine the extent and magnitude of methamphetamine contamination in a property.
Inspection	Close and careful scrutiny of a building carried out without dismantling, in order to arrive at a reliable conclusion as to the condition of the building.
Inspector	Person or organisation responsible for carrying out the inspection.
Instrument Testing	Where appropriate the carrying out of Tests using the following techniques and instruments: (a) electronic moisture detecting meter - an instrument used for assessing the moisture content of building elements (b) stethoscope - an instrument used to hear sounds made by termites within building elements (c) probing - a technique where timber and other materials/areas are penetrated with a sharp instrument (e.g. bradawl or pocket knife), but does not include probing of decorative timbers or finishes, or the drilling of timber and trees and (d) sounding - a technique where timber is tapped with a solid object. (e) T3I - an instrument used to detect movement, moisture and changes in temperature within timber
Limitation	Any factor that prevents full or proper inspection of the building.
Major defect	A defect of sufficient magnitude where rectification has to be carried

	out in order to avoid unsafe conditions, loss of utility or further deterioration of the property.
Methamphetamine	An amphetamine-type stimulant that is highly addictive. Methamphetamine is a controlled substance, classified as a Class A (very high-risk) drug under the Misuse of Drug Act. This term is used as a grouping term to include all substances screened for, specifically: Ephedrine, Pseudoephedrine,Amphetamine, Methamphetamine, MDA and MDMA.
Methamphetamine contamination	A property or part of a property where the level of methamphetamine has been tested in accordance with this standard and found to exceed 0.5 micrograms/100 cm2 (Residential) or 10 micrograms/100 cm2 (Commercial).
Methamphetamine production/manufacture	The manufacture of methamphetamine, including processing, packaging, and storage of methamphetamine and associated chemicals.
Minor defect	A defect other than a major defect.
Roof space/Roof void	Space between the roof covering and the ceiling immediately below the roof covering.
Screening assessment	An assessment by a screening sampler to determine whether or not methamphetamine is present.
Serviceability defect	Fault or deviation from the intended serviceability performance of a building element.
Significant item	An item that is to be reported in accordance with the scope of the inspection.
Site	Allotment of land on which a building stands or is to be erected.
Structural defect	Fault or deviation from the intended structural performance of a building element.
Structural element	Physically distinguishable part of a structure. NOTE: For example wall, columns, beam, connection.
Subfloor space	Space between the underside of a suspended floor and the ground.
Subterranean Termite Management Proposal	A written proposal in accordance with Australian Standard AS 3660.2 to treat a known subterranean termite infestation and/or manage the risk of concealed subterranean termite access to buildings and structures.
Termites	Wood destroying insects belonging to the order 'Isoptera' which commonly attack seasoned timber.
Tests	Additional attention to the visual examination was given to those accessible areas which the consultant's experience has shown to be

	particularly susceptible to attack by Termites. Instrument Testing of those areas and other visible accessible timbers/materials/areas showing evidence of attack was performed.
Timber Pest Activity	Tell-tale signs associated with 'active' (live) and/or 'inactive' (absence of live) Timber Pests at the time of inspection.
Timber Pest Attack	Timber Pest Activity and/or Timber Pest Damage.
Timber Pest Damage	Noticeable impairments to the integrity of timber and other susceptible materials resulting from an attack by Timber Pests.
Urgent and Serious Safety Hazards	Building elements or situations that present a current or immediate potential threat of injury or disease to persons.

Terms on which this report was prepared

This report is based on the condition of the property at the time of inspection. We strongly recommend re-inspection 30 days after this report is issued as the general condition of the property is likely to have changed, including the extent of defects described and instance of potential undetected defects.

This report has been prepared in accordance with and subject to the pre-inspection agreement in place between the parties, which forms part of this Report.

This Report is prepared for the client identified above and may not be relied on by any other person without our express permission or by the purchase of this Report on our website.

SPECIAL ATTENTION SHOULD BE GIVEN TO THE SCOPE, LIMITATIONS AND EXCLUSIONS IN YOUR PRE-INSPECTION AGREEMENT AND THIS REPORT

Any of the exclusions or limitations identified for this Report may be the subject of a special-purpose inspection which we recommend being undertaken by an appropriately qualified inspector

RELIANCE AND DISCLOSURE

This report has been prepared based on conditions at the time of the report.

We own the copyright in this report and may make it available to third parties.

If your Property is in the Australian Capital Territory, you acknowledge we will make certain information about this Report available to the ACT Government for inclusion in the building and pest inspections public register if required under the *Civil Law (Sale of Residential Property) Act 2003* . This will include the fact the report has been prepared, the Property street address, date of the inspection, the name of the person who prepared the report and (if applicable) the entity that employs them.

UNDETECTED DEFECT RISK RATING

If this Report has identified a medium or high-risk rating for undetected defects, we strongly recommend a further inspection of areas that were inaccessible. This may include an invasive inspection that requires the removal or cutting of walls, floors or ceilings.

If the Property has been vacant for a period of time, moisture levels or leaks may not be detectable at the time of the inspection because often only frequent use of water pipes (showers, taps etc) result in a leak being identifiable. We advise further testing on pipes and water susceptible areas (such as the bathroom and laundry) after more frequent use has occurred.

IMPORTANT SAFETY INFORMATION:

This is not a report by a licensed plumber or electrician. We recommend a special-purpose

report to detect substandard or illegal plumbing and electrical work at the Property

This is not a smoke alarm report. We recommend all existing detectors in the Property be tested and advice sought as to the suitability of number, placement and operation.

This is not an asbestos report. There are potential products in the Property containing asbestos that will not be identified in this report. In order to accurately identify asbestos, we recommend performing an asbestos inspection, particularly for buildings built prior to 1988.

This is not a report on safety glass. Glazing in older homes may not reflect current standards and may cause significant injury if damaged. Exercise caution around the glass in older homes.

This is not a report on window opening restrictions. We have not inspected window opening restrictors. Window openings in older buildings may not reflect current standards and can be a potential risk. Window opening restrictors are advised for all second story or above windows with sill heights below 900mm. Some states make this a mandatory requirement. Owners should enquire of their local and state requirements to ensure compliance.

This is not a report on pool safety. If a swimming pool is present it should be the subject to a special purpose pool inspection.

External Timber Structures - Balcony and Decks. It is strongly recommended that a Structural Engineer is required to assess distributed load capacity of external timber structures such as balconies and decks, alerting users of the load capacity. Regular maintenance and inspections by competent practitioners to assess the ongoing durability of exposed external timber structures are needed.

This is not a Group Titled Property Report as per AS4349.2. If you require a report for a Group Titled Property as per this standard, please seek a separate inspection for Group Titled Properties.

MOISTURE

The identification of moisture, dampness or the evidence of water penetration is dependent on the weather conditions at the time an inspection. The absence of dampness identified in this Report does not necessarily mean the Property will not experience some damp problems in other weather conditions or that roofs, walls or wet areas are watertight.

Where the evidence of water penetration is identified we recommend detailed investigation of waterproofing in the surrounding area monitoring of the affected area over a period of time to fully detect and assess the cause of dampness.

MAINTENANCE OF THE PROPERTY

This Report is not a warranty or an insurance policy against problems developing with the Property in the future. Accordingly, a preventative maintenance program should be implemented which includes systematic inspections, detection and prevention of issues. Please contact the inspector who carried out this inspection for further advice.

It is strongly advised that appropriate steps be taken to remove, rectify or monitor any evidence of

conditions conducive to timber pest activity. Undertaking thorough regular inspections at intervals not exceeding twelve months (or more frequent inspections where the risk of timber pest attack is high or the building type is susceptible to attack). To further reduce the risk of subterranean termite attack, implement a management program in accordance with Australian Standard AS3660. This may include the installation of a monitoring and/or baiting system, or chemical and/or physical barrier. However, AS3660 stresses that subterranean termites can bridge or breach barrier systems and inspection zones and those thorough regular inspections of the building are necessary.

NO CERTIFICATION

a) The Property has been compared to others of a similar age, construction type and method that had an acceptable level of basic maintenance completed.

b) We don't advise you about title, ownership or other legal matters like easements, restrictions, covenants and planning laws. None of our inspections constitutes approval by a Building Surveyor, a certificate of occupancy or compliance with any law, regulation or standard, including any comment on whether the Property complies with current Australian Standards, Building Regulations or other legislative requirements.

RECTIFICATION COSTS

We don't provide advice on the costs of rectification or repair unless specifically identified in the scope of the Report. Any cost advice provided verbally or in this report must be taken as of a general nature and is not to be relied on. Actual costs depend on the quality of materials, the standard of work, what price a contractor is prepared to do the work for and may be contingent on approvals, delays and unknown factors associated with third parties. No liability is accepted for costing advice.
