BEFORE YOU BUY
BEFORE YOU BUILD

Building and Timber Pest Inspection Report

Inspection Date: Mon, 16 Mar 2026

Property Address: 44 Brooklyn Rd, Brooklyn NSW 2083, Australia

Contents

If you have any queries with this report or require further information, please do not hesitate to contact the person who carried out the inspection.

This Report has been prepared in accordance with the pre-inspection agreement in place between the parties set out below, which set out the purpose and scope of the inspection, and the significant items that will be reported on. This Report reflects the opinion of the inspector based on the documents that have been provided. This Report should be read in its entirety and in the context of the agreed scope of Services. If there is a discrepancy between the summary findings and the body of the Report, the body of the Report will prevail. We recommend that you should promptly implement any recommendation or advice in this Report, including recommendations of further inspections by another specialist. If you have any queries with this Report or require further information, please do not hesitate to contact the person who carried out the inspection. This Report contains reference to material that is the copyright of Standards Australia reproduced under agreement with SAI Global to Jim's Building Inspections (Australia).

Original Inspection Date: Mon, 16 Mar 2026

The Parties

Name of the Client:	
Name of the Principal(If Applicable):	
Job Address:	44 Brooklyn Rd, Brooklyn NSW 2083, Australia
Client's Email Address:	
Client's Phone Number:	
Consultant:	Charlie Lichaa Ph: 0452342126 Email: Cherrybrook@jimsbuildinginspections.com.au
	Builders licence 66460C
Company Name:	Jim's Building Inspections (Cherrybrook)
Company Address and Postcode:	Cherrybrook 2126
Company Email:	Cherrybrook@jimsbuildinginspections.com.au
Company Contact Numbers:	0452342126

Special conditions or instructions

A report may be conditional on information provided by the person, agents or employees of the person requesting the report, apparent concealment of possible defects and a range of other factors

The following apply:

Section A Results of Inspection - summary

A summary of your inspection is outlined below; please also refer to the Report.

	Found	Not Found
Safety Hazard	✔	
Major Defect	✔	
Minor Defect	✔	
Live Timber Pest Activity		✔
Timber Pest Damage	✔	
Conditions Conducive to Timber Pest Activity	✔	
Evidence of fungal decay activity and/or damage	✔	
Evidence of wood borer activity and/or damage		✔
Evidence of a previous termite management program		✔

Overall Condition (Building)

In summary, the building, compared to others of similar age and construction is in the condition documented in this report.

Overall Condition (Timber Pest)

In summary, the building, compared to others of similar age and construction is highly susceptible to timber pests. A termite treatment is required.

Section B General

General description of the property

Building Type	Detached, Residential
Company or Strata title	No
Floor	Masonry Piers, Suspended Timber Frame
Furnished	Furnished
No. of bedrooms	3
Occupied	Occupied
Orientation	West
Other Building Elements	Carport, Driveway, Pergola, Retaining Walls, Shed
Other Timber Bldg Elements	Architraves, Deck, Door Frames, Doors, Eaves, Fascias, Floorboards, Internal Joinery, Skirting Boards, Stair Railing, Staircase, Stumps, Veranda Posts, Weatherboards, Window Frames
Roof	Corrugated Iron (e.g. Colourbond)
Storeys	Double
Walls	Brick Veneer (Timber Framed)
Weather	Fine

Section C Accessibility

Areas Inspected

The following areas were inspected. As documented in your Pre-Inspection Agreement, obstructions and limitations to the accessible areas for inspection are to be expected in any inspection. Refer also to our listing of obstructions and limitations.

- Exterior

- Interior

- Gardens

- Roof Exterior - First Floor Only

- Subfloor - Part

- Trees

- Wall Exterior

The inspection excludes areas which are affected by obstructions, where access is limited or unsafe. We do not move obstructions and defects, timber pest activity or conditions conducive to these may not be obvious unless they are removed.

Inaccessible Areas

The following areas were inaccessible:

- Areas of low roof pitch preventing full inspection.

- Areas of skillion or flat roof - no access

- Ceiling Cavity.

- Subfloor - Part.

- Wall exterior due to obstructions.

Any areas which are inaccessible at the time of inspection present a high risk for undetected defects and timber pest activity and conditions conducive to these. The client is advised to make inaccessible areas accessible wherever possible for re-inspection.

Obstructions and Limitations

Building defects, termite and timber pest activity as well as conditions conducive to both, may be concealed by the following obstructions which prevented full inspection:

- Above safe working height

- Appliances and equipment

- Areas of low roof pitch preventing full inspection

- Areas of skillion or flat roof - no access

- Ceiling linings

- External concrete or paving

- External finished ground level

- Fixed ceilings

- Fixed Furniture - Built-in Cabinetry

- Floor coverings

- Furniture

- Overhanging vegetation

- Roof framing - not trafficable

- Stored items, built in cabinetry, furniture and personal items obscured approximately 50% of every room.

- Subfloor area - Limited access due to restrictive crawl space

- Subfloor was obscured due to poor clearance and obstructions. Less than 50% of the inspectable area was accessible.

- Wall linings

- Webbing of roof trusses - not trafficable

The presence of obstructions increases the risk of undetected building defects, timber pest activity and conditions conducive to these. The client should make arrangement to remove obstructions where ever possible and re-inspect these areas urgently.

Undetected defect risk (Building)

A risk rating is provided to help you understand the degree to which accessibility issues and the presence of obstructions have limited the scope of the inspection

The risk of undetected defects is: **High**

When the risk of undetected defects is medium or high we strongly recommend further inspection once access is provided or if the obstruction can be removed. Contact us for further advice.

Undetected defect risk (Timber Pest)

A risk rating is provided to help you understand the degree to which accessibility issues and the presence of obstructions have limited the scope of the inspection

The risk of undetected defects is: **High**

When the risk of undetected defects is medium or high we strongly recommend further inspection once access is provided or if the obstruction can be removed. Contact us for further advice.

Section D Significant Items

Safety Hazard

Finding 1.01

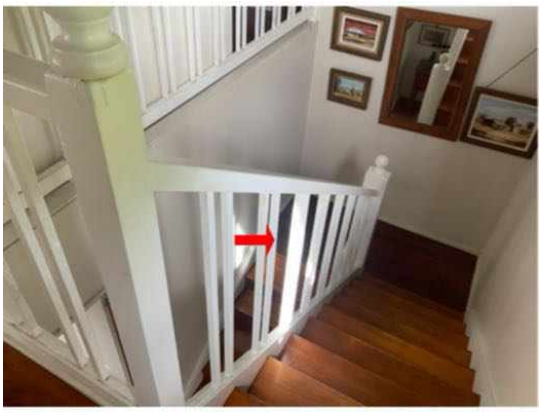
Building:	Main Building
Location:	Stairs - Internal
Finding:	Balustrade - Suspected Non-Compliance
Information:	The balustrade was measured and found to less than the present building regulation requirement of 1000mm high. Additionally the gaps between the balustrade cladding were found to be greater than the present building regulation requirement of 125mm.

As with all constructions, compliance for a particular dwelling need only meet the regulations of the build date and not necessarily future changes to specific building regulations.

Some changes to the building regulations are made to ensure the safety of all inhabitants and balustrades are definitely one of those crucial regulations.

This defect creates a potential safety hazard and should be rectified as soon as possible to ensure the safety of the area and to meet present building standards and regulations.

A registered builder should be contacted to discuss possible rectification solutions.



Major Defect

Finding 2.01

Building:	Main Building
Location:	Exterior walls - right side
Finding:	Brickwork - Cracking [Repair required]

Information:

Major cracking was identified to the brickwork in this area. Cracks of this type are likely to have been caused by minor expected movement of building elements, but may also have a structural cause that is more significant.

A crack of this size may be repaired by extensive filling. Additionally, further remedial works to associated building elements, such as eave sheeting or external door frames, is likely to be required.

A qualified bricklayer should be contacted immediately to estimate and perform repair and restoration works. Consultation with a structural engineer may be required where structural instability is found to be the underlying cause of the cracking.

Always contact a building inspector should cracks widen, lengthen, or become more numerous.

Finding 2.02

Building:	Main Building
Location:	Bedroom - Master
Finding:	Evidence of excessive moisture was present at the time of inspection
Information:	Excessive moisture can attract termites and produce conditions that promote termite attack, fungal growth and wood decay. Excessive moisture is generally caused by deteriorated, inadequate or missing roof drainage, leaking plumbing pipes or fixtures, poorly plumbed HWS overflows or condenser units and poor site drainage. It is highly recommended that all plumbing and drainage fixtures and fittings be maintained regularly in order to prevent excessive moisture being present in the external / internal property.

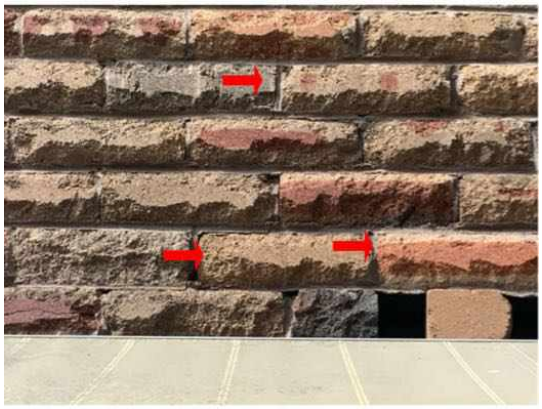
Minor Defect

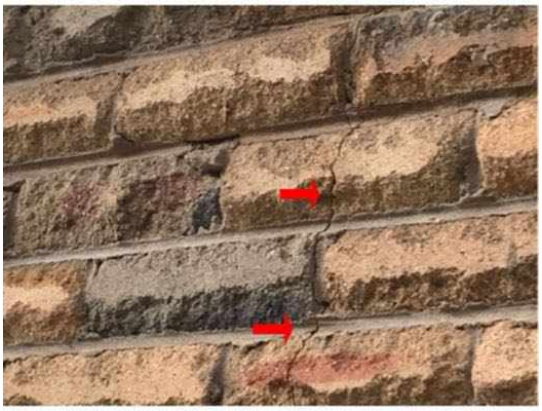
Finding 3.01

Building:	Main Building
Location:	Exterior walls - right side
Finding:	Brickwork - Step cracking
Information:	Step cracking was identified to the brickwork in this area at the time of inspection. Step cracking, which is similar to other forms of cracking, has a variety of possible causes. However, the most common is the subsidence of adjacent footings.

Step cracking is a relatively common defect, and is most likely to occur adjacent to windows, doors and other openings. Mortar failure in the gaps between affected bricks indicates the stresses and tensions affecting the wall.

Where step cracking is extensive or severe, the client is advised to consult a structural engineer. Minor step cracking can be used as a warning sign to address factors causing stress to the wall, which can include the effect of surrounding trees, water leaks, soil erosion, or even the presence of reactive soils in the surrounding area.





Finding 3.02

Building:	Main Building
Location:	Exterior walls - rear
Finding:	Retaining wall - Defective
Information:	The retaining wall in this are was found to be defective at the time of inspection. Generally, defective retaining walls are caused by poor original design or material use. However, deteriorated retaining walls may also be a result of substandard construction, poor site drainage or unmanaged stormwater flows. If left unmanaged, the retaining wall may become a safety hazard if it continues to destabilise. Significant repair and replacement should be expected. Where retaining walls are considered structural walls, a structural engineer / surveyor should be consulted regarding required remedial works. Otherwise, a landscaper or retaining wall installer may be appointed to repair or replace the wall, at the discretion of the client.

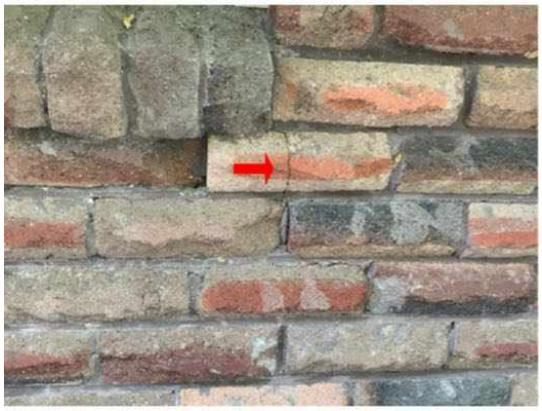
Finding 3.03

Building:	Main Building
Location:	Exterior walls - rear
Finding:	Brickwork - Cracking noticeable
Information:	There were several cracks and or crack repairs evident to external brickwork.

Noticeable cracks are a common occurrence in external brickwork and are a likely result of age expected building movement, general expansion, and/or contraction of building materials in different weather conditions. Noticeable cracks in brickwork may develop if left unattended, with potential for necessitating major remedial works or replacement of the brickwork.

It is highly advised that a qualified bricklayer be appointed to provide necessary works to cracked brickwork to prevent any further damage. Such works should be conducted as soon as possible.

Always monitor these cracks and contact a building inspector should cracks widen, lengthen, or become more numerous.



Finding 3.04

Building:	Main Building
Location:	Bedroom - Master
Finding:	Sub-floor excessive moisture
Information:	Excessive moisture can attract termites and produce conditions that promote termite attack fungal growth in wood decay.

Excessive moisture is generally caused by inadequate subfloor ventilation and poor site drainage.

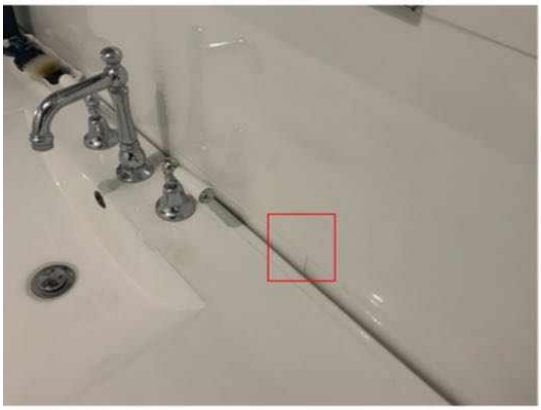
There appear to be inadequate vents installed to the perimeter of the building and I would suggest that further solar powered fans or the like be installed to improve crossflow ventilation and aid in keeping the subfloor area relatively dry.

The installation of additional surface drainage to the front of the property would also be beneficial to keeping the subfloor dry.

It is highly recommended that subfloor ventilation and site drainage be improved and maintained regularly in order to prevent excessive moisture being present in the external/internal property.

Finding 3.05

Building:	Main Building
Location:	Bathroom
Finding:	Bathroom cabinetry - not sealed
Information:	Areas of bathroom cabinetry have not been fully sealed or have been sealed in a substandard manner. All junctions between bench tops and adjoining surfaces are defective if they are not sealed with an agreed or suitable flexible sealant or if leaks occur or where they are not installed to manufacturer's instructions.



Live Timber Pest Activity

No evidence was found

Timber Pest Damage

Finding 5.01

Building:	Main Building
Location:	Exterior walls - rear
Finding:	Tree stumps
Information:	Where tree stumps are in direct contact with the ground and consequently moisture or dampness they become conducive to termite activity as they can provide an environment that is attractive to termite infestation.

When met with excessive moisture timber begins to decay and develop wood rot.

Any tree stumps that are in direct contact with external grounds provide Ingress for subterranean termites into that particular element.

The removal of any tree stumps that may be conducive to termite activity should be removed as soon as possible to minimise the risk of termite attack or alternatively drill and testing all tree stumps will be required to determine the presence of termite activity

Conditions Conducive to Timber Pest Activity

Finding 6.01

Building:	Main Building
Location:	Exterior walls - front
Finding:	Bridging - Vegetation
Information:	Where vegetation obstructs inspection of building elements, also known as bridging as it provides a bridging point for the access of termites, full inspection can not be achieved. Consequently moisture or dampness may be present and the areas becomes conducive to termite activity. Plants against or very close to buildings

provide cover, shade and can provide an environment that is attractive to termite infestation.

The removal and replanting of species that do not provide "cover" or cutting back of existing vegetation will assist greatly in preventing Bridging from occurring.

The removal of any such materials that may be conducive to termite activity should be carried out as soon as possible and arrange re inspection to minimize the risk of termite attack.

Finding 6.02

Building:	Main Building
Location:	Exterior walls - right side
Finding:	Garden Beds - Conditions Conducive to Termites
Information:	Garden beds were found to be evident in the garden area. These garden beds can include untreated timber, and with a combination of moisture from watering hosing can make conditions conducive to termite activity and termite ingress.

Finding 6.03

Building:	Main Building
Location:	Exterior walls - right side

Finding: Air conditioner - Disconnected overflow

Information: The Air Conditioner (A/C) overflow was found to be disconnected from storm water drainage and is creating excessive moisture in the surrounding area.

Such leaking creates an environment which is conducive to an array of defects, including water damage to associated building elements and the attraction of termite or timber pest infestation.

It is highly recommended that a licensed plumber be appointed to connect the A/C overflow in order to prevent such an environment from being created. These minor works should be carried out as soon as possible.

Finding 6.04

Building: Main Building

Location: Exterior walls - rear

Finding: Roof plumbing - Missing

Information: Some sections of the roof are not adequately drained via gutters and downpipes. Gutters and downpipes that are not installed adequately are likely to result in excessively damp conditions against the exterior surfaces and around the base perimeter of the building.

Excessive moisture creates an environment which accelerates the deterioration of

building elements in the area, as well as being conducive to termite and pest infestation. Such an environment is likely to necessitate repair and/or replacement of building elements, which are prone to sustaining wood rot, rust or corrosion.

A roofing plumber should be appointed as soon as possible to install relevant roof plumbing materials. Depending on the extent of the damage, repair and/or replacement of damaged building elements may be required.

Finding 6.05

Building:	Main Building
Location:	Exterior walls - left side
Finding:	Site drainage - Inadequate
Information:	The site drainage in this area was found to be inadequate at the time of inspection, creating potential for subsequent water damage to associated building elements.

It is important that water does not lie against the base of walls; surrounding paths and ground levels should be sloped to drain water away from walls. Downpipes should not disgorge stormwater onto lower walls or plinths. Stormwater should be carried away by large, regularly cleaned drains. Ground levels may need to be lowered to expose a buried DPC.

Where site drainage is inadequate, installation of an Agricultural (Aggie) Drain may be required. A qualified plumber should be appointed to further inspect the property and perform any remedial works as necessary. Water damage and secondary defects are likely to occur if left unmanaged.

Finding 6.06

Building:	Main Building
Location:	Subfloor
Finding:	HWS Overflow - Not Connected
Information:	The Hot Water System (HWS) overflow was found to be disconnected from storm water drainage and is creating excessive moisture in the surrounding area.

These damp conditions can lead to secondary defects such as rot, rust or corrosion of associated building elements, the formation of fungal decay, or even the creation of potential slip hazards. When coupled with poor site drainage, pooling of water may also attract termite activity to this area.

It is highly recommended that a licensed plumber be appointed to connect the HWS overflow in order to prevent such an environment from being created. These minor works should be carried out as soon as possible.

Finding 6.07

Building:	Main Building
Location:	Subfloor
Finding:	Untreated or non-durable timbers in a hazardous environment
Information:	To reduce the risk of timber pest attack it is essential that timber used in a hazardous environment (e.g. in direct contact with the ground or frequently exposed to damp conditions) is of sufficient durability and/or is adequately preservative treated.

Untreated timbers in direct contact with the ground are likely to develop severe wood rot and/or fungal decay if left unattended creating attraction for subterranean termites to infest the timbers from surrounding areas.

If untreated or non-durable timbers are found to be in a hazardous environment it is highly advised that replacement of these building elements be performed as soon as possible to aid the protection of the property against termite / timber pest attack.

Finding 6.08

Building:	Main Building
Location:	Subfloor
Finding:	subfloor drainage poorly drained
Information:	Poor drainage leads to excessive moisture, entering the subfloor area and being retained in the soil, which overtime can destabilise the foundations and promote timber pest activity such as fungal decay and termite.

Drainage problems often, only discernible during wet periods.

Note: The effect of poor drainage on foundations is often dependent on the soil type. Establishing soil type is beyond the scope of the standard prepurchase inspections. Also, timber pest activity, including termites, and fungal decay, commonly associated with poor drainage.

Generally, to ensure that water drains away from the footings, the profile of the ground adjacent to the building should slope away from the base of the exterior walls, and all stormwater drainage should be maintained in good condition and free from blockage.

If the ground level of the subfloor area is fully or partly below, the surrounding ground level, then well designed retaining walls with appropriate drainage are required to prevent water entering the subfloor area.

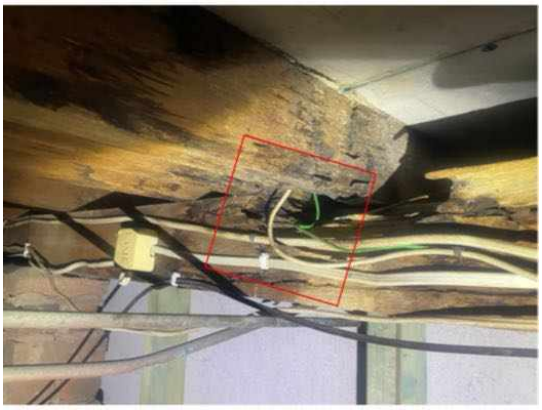
Evidence of fungal decay activity and/or damage

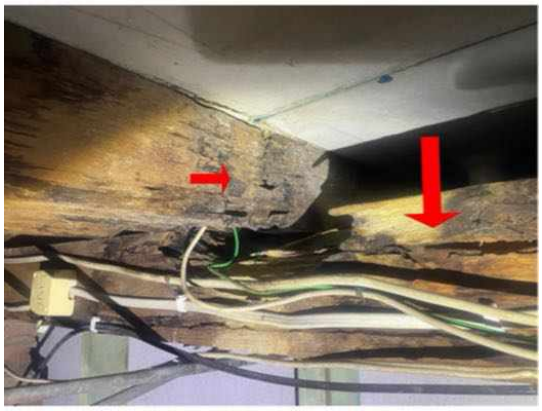
Finding 7.01

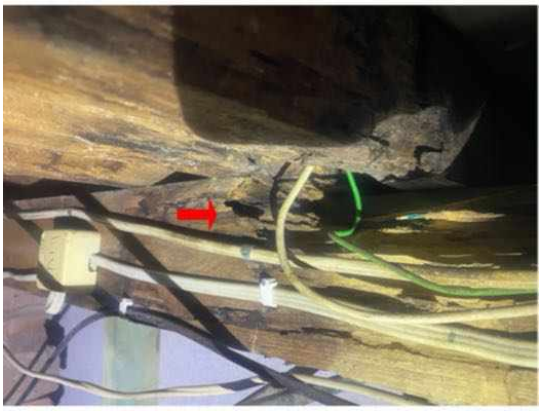
Building:	Main Building
Location:	Subfloor
Finding:	Subfloor structure - Wood rot
Information:	The subfloor structures are showing signs of deterioration and wood rot (fungal decay) of the timbers. It is suspected that this defect has developed as a result of an old leak in the bathroom.

Damp conditions cause the timbers to fail, resulting in the subfloor structures failing to bear the load (or weight) of the building as originally intended. Without repairs and maintenance, including potential replacement of affected elements, it is likely that serious structural faults will result, as well as an array of minor defects.

Where wood rot is present to any structural timber, rectification or replacement of the affected timber building element is required. The adequate timeframe for such works are dependent on the severity of the rot. Where rot has developed to become widespread, replacement of sections of the subfloor structure may be required. Consultation with a structural engineer or registered builder specialising in re-stumping is highly advised as soon as possible.







Evidence of wood borer activity and/or damage

No evidence was found

Section D Significant Items

D4 Further Inspections

We advise that you seek additional specialist inspections from a qualified and, where appropriate, licensed

- Sub Floor Ventilation Specialist

- Licensed Plumber specialising in Roof Plumbing

- Damp Proofing Specialist

Jim's Building Inspections can put you in contact with qualified and licensed providers of these and other trades services. Please contact your inspector for recommendations, or visit www.jims.net.

D5 Conclusion - Assessment of overall condition of property

- The building appears to be in fair condition compared to buildings of similar age and construction .minor and major defects and safety hazards were found at the time of the inspection.

The following recommendations are highly advised to avoid further damage or deterioration of the building elements:

-Maintenance is required to windows
-Adequately connect all overflow pipes to the stormwater drainage.

-apply sealant grout where required
-improve subfloor ventilation
-address site drainage.
-install missing gutters
-replace damaged bearers in the subfloor.
-address high moisture level in the subfloor

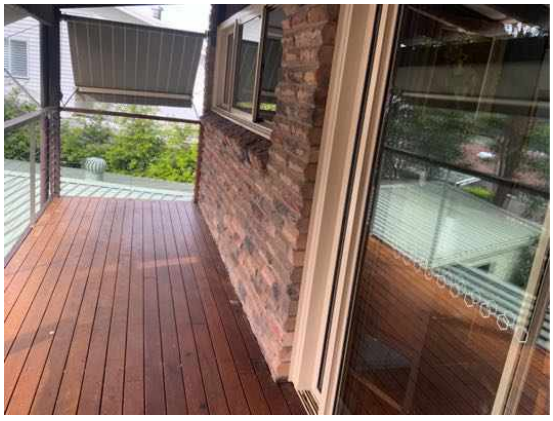
For further information, advice and clarification please contact Charlie Lichaa on: 0452342126

Section D Significant Items

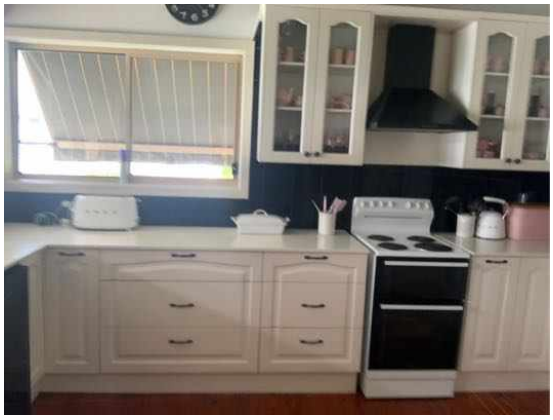
The following items were noted as - For your information

Noted Item

Building:	Main Building
Location:	All Areas
Finding:	Additional Photos - Obstructions and Limitations
Information:	These photographs are an indication of the obstructions and limitations which impeded full inspection of the property at the time of inspection. These obstructions can hide an array of defects and should be removed to allow full inspection to be carried out. A re-inspection is recommended once the areas are made accessible.



LOUIE



Noted Item

Building: Main Building
Location: Exterior walls - rear
Finding: Structure - Old and non-compliant
Information: This structure, whilst appearing to provide adequate structural support, does not comply with contemporary building practices and current Australian Standards.

Although this is not a requirement in older homes, the client should be aware of the age and non-compliance of the structure when planning any repairs or remodelling.

It is advised that this structure be inspected by a registered builder or structural engineer on a relatively frequent basis to ensure that the structural integrity does not falter over time.

Noted Item

Building: Main Building
Location: Exterior walls - rear
Finding: Asbestos - Suspected ACM Identified on Site
Information: Reporting on Asbestos is outside the Scope of this Report. This suspected defect is highlighted as a caution only. We suspect, based on our experience in the building industry, that there is a higher risk of the identified building element containing asbestos.

As Asbestos Reporting is outside the scope of this report, we advise that you consider a separate Asbestos Inspection and Condition Audit, which can include the taking of samples for definitive confirmation of the presence of Asbestos.

In the interim, the client is advised to act with caution, especially when considering any damage to building materials general wear and tear renovations extensions demolition and general maintenance activities due to the suspected presence of Asbestos.

Noted Item

Building:	Main Building
Location:	Exterior walls - left side
Finding:	Structure - Old and non-compliant
Information:	This structure, whilst appearing to provide adequate structural support, does not comply with contemporary building practices and current Australian Standards.

Although this is not a requirement in older homes, the client should be aware of the age and non-compliance of the structure when planning any repairs or remodelling.

It is advised that this structure be inspected by a registered builder or structural engineer on a relatively frequent basis to ensure that the structural integrity does not falter over time.

Definitions to help you better understand this report

Access hole (cover)	An opening in flooring or ceiling or other parts of a structure (such as service hatch, removable panel) to allow for entry to carry out an inspection, maintenance or repair.
Accessible area	An area of the site where sufficient, safe and reasonable access is available to allow inspection within the scope of the inspection.
Appearance defect	Fault or deviation from the intended appearance of a building element.
Asbestos-Containing Material (ACM)	Asbestos-containing material (ACM) means any material or thing that, as part of its design, contains asbestos.
Building element	A portion of a building that, by itself or in combination with other such parts, fulfils a characteristic function. NOTE: For example supporting, enclosing, furnishing or servicing building space.
Client	The person or other entity for whom the inspection is being carried out.
Conditions Conducive to Termite Activity	Noticeable building deficiencies or environmental factors that may contribute to the presence of Termites.
Defect	Fault or deviation from the intended condition of a material, assembly, or component.
Detailed assessment	An assessment by an accredited sampler to determine the extent and magnitude of methamphetamine contamination in a property.
Inspection	Close and careful scrutiny of a building carried out without dismantling, in order to arrive at a reliable conclusion as to the condition of the building.
Inspector	Person or organisation responsible for carrying out the inspection.
Instrument Testing	Where appropriate the carrying out of Tests using the following techniques and instruments: (a) electronic moisture detecting meter - an instrument used for assessing the moisture content of building elements (b) stethoscope - an instrument used to hear sounds made by termites within building elements (c) probing - a technique where timber and other materials/areas are penetrated with a sharp instrument (e.g. bradawl or pocket knife), but does not include probing of decorative timbers or finishes, or the drilling of timber and trees and (d) sounding - a technique where timber is tapped with a solid object. (e) T3I - an instrument used to detect movement, moisture and changes in temperature within timber
Limitation	Any factor that prevents full or proper inspection of the building.
Major defect	A defect of sufficient magnitude where rectification has to be carried

	out in order to avoid unsafe conditions, loss of utility or further deterioration of the property.
Methamphetamine	An amphetamine-type stimulant that is highly addictive. Methamphetamine is a controlled substance, classified as a Class A (very high-risk) drug under the Misuse of Drug Act. This term is used as a grouping term to include all substances screened for, specifically: Ephedrine, Pseudoephedrine,Amphetamine, Methamphetamine, MDA and MDMA.
Methamphetamine contamination	A property or part of a property where the level of methamphetamine has been tested in accordance with this standard and found to exceed 0.5 micrograms/100 cm2 (Residential) or 10 micrograms/100 cm2 (Commercial).
Methamphetamine production/manufacture	The manufacture of methamphetamine, including processing, packaging, and storage of methamphetamine and associated chemicals.
Minor defect	A defect other than a major defect.
Roof space/Roof void	Space between the roof covering and the ceiling immediately below the roof covering.
Screening assessment	An assessment by a screening sampler to determine whether or not methamphetamine is present.
Serviceability defect	Fault or deviation from the intended serviceability performance of a building element.
Significant item	An item that is to be reported in accordance with the scope of the inspection.
Site	Allotment of land on which a building stands or is to be erected.
Structural defect	Fault or deviation from the intended structural performance of a building element.
Structural element	Physically distinguishable part of a structure. NOTE: For example wall, columns, beam, connection.
Subfloor space	Space between the underside of a suspended floor and the ground.
Subterranean Termite Management Proposal	A written proposal in accordance with Australian Standard AS 3660.2 to treat a known subterranean termite infestation and/or manage the risk of concealed subterranean termite access to buildings and structures.
Termites	Wood destroying insects belonging to the order 'Isoptera' which commonly attack seasoned timber.
Tests	Additional attention to the visual examination was given to those accessible areas which the consultant's experience has shown to be

	particularly susceptible to attack by Termites. Instrument Testing of those areas and other visible accessible timbers/materials/areas showing evidence of attack was performed.
Timber Pest Activity	Tell-tale signs associated with 'active' (live) and/or 'inactive' (absence of live) Timber Pests at the time of inspection.
Timber Pest Attack	Timber Pest Activity and/or Timber Pest Damage.
Timber Pest Damage	Noticeable impairments to the integrity of timber and other susceptible materials resulting from an attack by Timber Pests.
Urgent and Serious Safety Hazards	Building elements or situations that present a current or immediate potential threat of injury or disease to persons.

Terms on which this report was prepared

This report is based on the condition of the property at the time of inspection. We strongly recommend re-inspection 30 days after this report is issued as the general condition of the property is likely to have changed, including the extent of defects described and instance of potential undetected defects.

This report has been prepared in accordance with and subject to the pre-inspection agreement in place between the parties, which forms part of this Report.

This Report is prepared for the client identified above and may not be relied on by any other person without our express permission or by the purchase of this Report on our website.

SPECIAL ATTENTION SHOULD BE GIVEN TO THE SCOPE, LIMITATIONS AND EXCLUSIONS IN YOUR PRE-INSPECTION AGREEMENT AND THIS REPORT

Any of the exclusions or limitations identified for this Report may be the subject of a special-purpose inspection which we recommend being undertaken by an appropriately qualified inspector

RELIANCE AND DISCLOSURE

This report has been prepared based on conditions at the time of the report.

We own the copyright in this report and may make it available to third parties.

If your Property is in the Australian Capital Territory, you acknowledge we will make certain information about this Report available to the ACT Government for inclusion in the building and pest inspections public register if required under the *Civil Law (Sale of Residential Property) Act 2003* . This will include the fact the report has been prepared, the Property street address, date of the inspection, the name of the person who prepared the report and (if applicable) the entity that employs them.

UNDETECTED DEFECT RISK RATING

If this Report has identified a medium or high-risk rating for undetected defects, we strongly recommend a further inspection of areas that were inaccessible. This may include an invasive inspection that requires the removal or cutting of walls, floors or ceilings.

If the Property has been vacant for a period of time, moisture levels or leaks may not be detectable at the time of the inspection because often only frequent use of water pipes (showers, taps etc) result in a leak being identifiable. We advise further testing on pipes and water susceptible areas (such as the bathroom and laundry) after more frequent use has occurred.

IMPORTANT SAFETY INFORMATION:

This is not a report by a licensed plumber or electrician. We recommend a special-purpose

report to detect substandard or illegal plumbing and electrical work at the Property

This is not a smoke alarm report. We recommend all existing detectors in the Property be tested and advice sought as to the suitability of number, placement and operation.

This is not an asbestos report. There are potential products in the Property containing asbestos that will not be identified in this report. In order to accurately identify asbestos, we recommend performing an asbestos inspection, particularly for buildings built prior to 1988.

This is not a report on safety glass. Glazing in older homes may not reflect current standards and may cause significant injury if damaged. Exercise caution around the glass in older homes.

This is not a report on window opening restrictions. We have not inspected window opening restrictors. Window openings in older buildings may not reflect current standards and can be a potential risk. Window opening restrictors are advised for all second story or above windows with sill heights below 900mm. Some states make this a mandatory requirement. Owners should enquire of their local and state requirements to ensure compliance.

This is not a report on pool safety. If a swimming pool is present it should be the subject to a special purpose pool inspection.

External Timber Structures - Balcony and Decks. It is strongly recommended that a Structural Engineer is required to assess distributed load capacity of external timber structures such as balconies and decks, alerting users of the load capacity. Regular maintenance and inspections by competent practitioners to assess the ongoing durability of exposed external timber structures are needed.

This is not a Group Titled Property Report as per AS4349.2. If you require a report for a Group Titled Property as per this standard, please seek a separate inspection for Group Titled Properties.

MOISTURE

The identification of moisture, dampness or the evidence of water penetration is dependent on the weather conditions at the time an inspection. The absence of dampness identified in this Report does not necessarily mean the Property will not experience some damp problems in other weather conditions or that roofs, walls or wet areas are watertight.

Where the evidence of water penetration is identified we recommend detailed investigation of waterproofing in the surrounding area monitoring of the affected area over a period of time to fully detect and assess the cause of dampness.

MAINTENANCE OF THE PROPERTY

This Report is not a warranty or an insurance policy against problems developing with the Property in the future. Accordingly, a preventative maintenance program should be implemented which includes systematic inspections, detection and prevention of issues. Please contact the inspector who carried out this inspection for further advice.

It is strongly advised that appropriate steps be taken to remove, rectify or monitor any evidence of

conditions conducive to timber pest activity. Undertaking thorough regular inspections at intervals not exceeding twelve months (or more frequent inspections where the risk of timber pest attack is high or the building type is susceptible to attack). To further reduce the risk of subterranean termite attack, implement a management program in accordance with Australian Standard AS3660. This may include the installation of a monitoring and/or baiting system, or chemical and/or physical barrier. However, AS3660 stresses that subterranean termites can bridge or breach barrier systems and inspection zones and those thorough regular inspections of the building are necessary.

NO CERTIFICATION

a) The Property has been compared to others of a similar age, construction type and method that had an acceptable level of basic maintenance completed.

b) We don't advise you about title, ownership or other legal matters like easements, restrictions, covenants and planning laws. None of our inspections constitutes approval by a Building Surveyor, a certificate of occupancy or compliance with any law, regulation or standard, including any comment on whether the Property complies with current Australian Standards, Building Regulations or other legislative requirements.

RECTIFICATION COSTS

We don't provide advice on the costs of rectification or repair unless specifically identified in the scope of the Report. Any cost advice provided verbally or in this report must be taken as of a general nature and is not to be relied on. Actual costs depend on the quality of materials, the standard of work, what price a contractor is prepared to do the work for and may be contingent on approvals, delays and unknown factors associated with third parties. No liability is accepted for costing advice.
